Form 10-K

(Mark One)

ANNUAL REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT OF 1934

For the fiscal year ended December 31, 2020

TRANSITION REPORT PURSUANT TO SECTION 13 OR 15(d) OF THE SECURITIES EXCHANGE ACT **OF 1934**

> For the transition period from to . Commission file number: 001-36740

FIBROGEN, INC.

(Exact name of registrant as specified in its charter)

Delaware

77-0357827

(State or other jurisdiction of incorporation or organization) 409 Illinois Street

(I.R.S. Employer Identification No.)

San Francisco, CA (Address of principal executive offices) 94158

(zip code)

Registrant's telephone number, including area code:

(415) 978-1200

Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Trading Symbol	Name of each exchange on which registered
Common Stock, \$0.01 par value	FGEN	The NASDAQ Global Select Market

Securities registered pursuant to Section 12(g) of the Act:

None

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. Yes 🗵 No 🗆

Indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Act. Yes \square No \square

Indicate by check mark whether the registrant: (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for such shorter period that the registrant was required to file such reports), and (2) has been subject to such filing requirements for the past 90 days. Yes ☑ No □

Indicate by check mark whether the registrant has submitted electronically every Interactive Data File required to be submitted pursuant to Rule 405 of Regulation S-T (§ 232.405 of this chapter) during the preceding 12 months (or for such shorter period that the registrant was required to submit such files). Yes $\ensuremath{\square}$ No $\ensuremath{\square}$

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, a non-accelerated filer, a smaller reporting company, or an emerging growth company. See the definitions of "large accelerated filer," "accelerated filer," "smaller reporting company," and "emerging growth company" in Rule 12b-2 of the

Exchange Act: Large accelerated filer **√** Accelerated filer Non-accelerated filer П Smaller reporting company П Emerging growth company

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act. \square

Indicate by check mark whether the registrant has filed a report on and attestation to its management's assessment of the effectiveness of its internal control over financial reporting under Section 404(b) of the Sarbanes-Oxley Act (15 U.S.C. 7262(b)) by the registered public accounting firm that prepared or issued its audit report. 🗹 Indicate by check mark whether the registrant is a shell company (as defined in Rule 12b-2 of the Act). Yes \square No \square

The aggregate market value of the voting and non-voting common equity held by non-affiliates of the registrant, computed by reference to the closing price as of the last business day of the registrant's most recently completed second fiscal quarter, June 30, 2020, was approximately \$2,127.6 million. Shares of Common Stock held by each executive officer and director and stockholders known by the registrant to own 10% or more of the outstanding stock based on public filings and other information known to the registrant have been excluded since such persons may be deemed affiliates. This determination of affiliate status is not necessarily a conclusive determination for other purposes

The number of shares of common stock outstanding as of January 31, 2021 was 91,560,468.

DOCUMENTS INCORPORATED BY REFERENCE

Items 10, 11, 12, 13 and 14 of Part III of this Annual Report on Form 10-K incorporate information by reference from the definitive proxy statement for the registrant's 2021 Annual Meeting of Stockholders to be filed with the Securities and Exchange Commission pursuant to Regulation 14A not later than after 120 days after the end of the fiscal year covered by this Annual Report on Form 10-K.

FORWARD-LOOKING STATEMENTS

This Annual Report filed on Form 10-K and the information incorporated herein by reference, particularly in the sections captioned "Risk Factors," "Management's Discussion and Analysis of Financial Condition and Results of Operations" and "Business," contains forwardlooking statements, which involve substantial risks and uncertainties. In this Annual Report, all statements other than statements of historical or present facts contained in this Annual Report, including statements regarding our future financial condition, business strategy and plans and objectives of management for future operations, are forward-looking statements. In some cases, you can identify forward-looking statements by terminology such as "believe," "will," "may," "estimate," "continue," "anticipate," "contemplate," "intend," "target," "project," "should," "plan," "expect," "predict," "could," "potentially" or the negative of these terms or other similar terms or expressions that concern our expectations, strategy, plans or intentions. Forward-looking statements appear in a number of places throughout this Annual Report and include statements regarding our intentions, beliefs, projections, outlook, analyses or current expectations concerning, among other things, our ongoing and planned preclinical development and clinical trials, the timing of and our ability to make regulatory filings and obtain and maintain regulatory approvals for roxadustat, pamrevlumab and our other product candidates, our intellectual property position, the potential safety, efficacy, reimbursement, convenience clinical and pharmaco-economic benefits of our product candidates, the potential markets for any of our product candidates, our ability to develop commercial functions, our ability to operate in China, expectations regarding clinical trial data, our results of operations, cash needs, spending of the proceeds from our initial public offering, financial condition, liquidity, prospects, growth and strategies, the industry in which we operate and the trends that may affect the industry or us. We have based these forward-looking statements largely on our current expectations and projections about future events and financial trends that we believe may affect our financial condition, results of operations, business strategy and financial needs.

These forward-looking statements are subject to a number of risks, uncertainties and assumptions described in the section of this Annual Report captioned "Risk Factors" and elsewhere in this Annual Report. A summary of these risk factors can be found in the following section, however please refer to the full risk factors in Item 1A "Risk Factors". These risks are not exhaustive. Other sections of this Annual Report may include additional factors that could adversely impact our business and financial performance. Moreover, we operate in a very competitive and rapidly changing environment. New risk factors emerge from time to time, and it is not possible for our management to predict all risk factors nor can we assess the impact of all factors on our business or the extent to which any factor, or combination of factors, may cause actual results to differ materially from those contained in, or implied by, any forward-looking statements.

You should not rely upon forward-looking statements as predictions of future events. We cannot assure you that the events and circumstances reflected in the forward-looking statements will be achieved or occur. Although we believe that the expectations reflected in the forward-looking statements are reasonable, we cannot guarantee future results, levels of activity, performance or achievements. The forward-looking statements made in this Annual Report are based on circumstances as of the date on which the statements are made. Except as required by law, we undertake no obligation to update publicly any forward-looking statements for any reason after the date of this Annual Report or to conform these statements to actual results or to changes in our expectations.

This Annual Report also contains market data, research, industry forecasts and other similar information obtained from or based on industry reports and publications, including information concerning our industry, our business, and the potential markets for our product candidates, including data regarding the estimated size and patient populations of those and related markets, their projected growth rates and the incidence of certain medical conditions, as well as physician and patient practices within the related markets. Such data and information involve a number of assumptions and limitations, and you are cautioned not to give undue weight to such estimates.

You should read this Annual Report with the understanding that our actual future results, levels of activity, performance and achievements may be materially different from what we expect. We qualify all of our forward-looking statements by these cautionary statements.

SUMMARY RISK FACTOR

The success of the Company will depend on a number of factors, many of which are beyond our control and involve risks, including but not limited to the following:

Risks Related to the Development and Commercialization of Our Product Candidates

- We are substantially dependent on the success of our lead product, roxadustat, and our second compound in development, pamrevlumab.
- As a company, we have limited commercialization experience, and the time and resources to develop such experience are significant. If we fail to achieve and sustain commercial success for roxadustat with our collaboration partners, our business would be harmed.
- Although regulatory approval has been obtained for roxadustat in China, Japan, and Chile, we may be unable to obtain regulatory approval for other countries, or such approval may be delayed or limited, due to a number of factors, many of which are beyond our control.
- The results of the FDA Cardiovascular and Renal Drugs Advisory Committee meeting may affect roxadustat's approvability or label in CKD anemia.
- Preclinical, Phase 1 and Phase 2 clinical trial results may not be indicative of the results that may be obtained in larger clinical trials.
- We do not know whether our ongoing or planned clinical trials of roxadustat or pamrevlumab will need to be redesigned based on interim results or if we will be able to achieve sufficient patient enrollment or complete planned clinical trials on schedule.
- Our product candidates may cause or have attributed to them undesirable side effects or have other properties that delay or prevent their regulatory approval or limit their commercial potential.
- · Clinical trials of our product candidates may not uncover all possible adverse effects that patients may experience.
- If we or our manufacturers cannot properly manufacture sufficient product, we may experience delays in development, regulatory approval, launch or successful commercialization.
- Regulatory authorities will do their own benefit risk analysis and may reach a different conclusion than we or our partners have, and these regulatory authorities may base their approval decision on different analyses, data, and statistical methods than ours.
- Even if we are able to obtain regulatory approval of our product candidates, the label we obtain may limit the indicated uses for which our product candidates may be marketed.
- · We face substantial competition in the discovery, development and commercialization of product candidates.
- No or limited reimbursement or insurance coverage of our approved products, if any, by third-party payors may render our products less attractive to patients and healthcare providers.

Risks Related to Severe Acute Respiratory Syndrome Coronavirus 2 and the Resulting Coronavirus Disease ("COVID-19")

Our business could continue to be adversely affected by the ongoing COVID-19 global pandemic.

Risks Related to Our Reliance on Third Parties

- If our collaborations were terminated or if Astellas or AstraZeneca were to prioritize other initiatives over their collaborations with us, our ability to successfully develop and commercialize our product candidates would suffer.
- If our preclinical and clinical trial contractors do not properly perform their agreed upon obligations, we may not be able to obtain or may be delayed in receiving regulatory approvals for our product candidates.
- We currently rely, and expect to continue to rely, on third parties to conduct many aspects of our product manufacturing and distribution, and these third parties may terminate these agreements or not perform satisfactorily.
- Certain components of our products are acquired from single-source suppliers or without long-term supply agreements. The loss of these suppliers, or their failure to supply, would materially and adversely affect our business.

Risks Related to Our Intellectual Property

- · If our efforts to protect our proprietary technologies are not adequate, we may not be able to compete effectively in our market.
- · Intellectual property disputes may be costly, time consuming, and may negatively affect our competitive position.
- Our reliance on third parties and agreements with collaboration partners requires us to share our trade secrets, which increases the
 possibility that a competitor may discover them or that our trade secrets will be misappropriated or disclosed.
- The cost of maintaining our patent protection is high and requires continuous review and diligence. We may not be able to effectively
 maintain our intellectual property position throughout the major markets of the world.
- The laws of some foreign countries do not protect proprietary rights to the same extent as do the laws of the U.S., and we may encounter significant problems in securing and defending our intellectual property rights outside the U.S.
- Intellectual property rights do not address all potential threats to any competitive advantage we may have.

The existence of counterfeit pharmaceutical products in pharmaceutical markets may compromise our brand and reputation and have a
material adverse effect on our business, operations and prospects.

Risks Related to Government Regulation

- The regulatory approval process is highly uncertain and we may not obtain regulatory approval for our product candidates.
- Our product candidates could fail to receive regulatory approval from the FDA or other regulatory authorities.
- Our current and future relationships with customers, physicians, and third-party payors are subject to healthcare fraud and abuse laws, false
 claims laws, transparency laws, privacy and security laws, and other regulations. If we are unable to comply with such laws, we could face
 substantial penalties.
- We are subject to laws and regulations governing corruption, which will require us to maintain costly compliance programs.
- We have identified material weaknesses in our internal control over financial reporting. If we are unable to remediate these, or if we otherwise fail to maintain an effective system of internal control, it may result in material misstatements in our financial statements.
- The impact of recent U.S. healthcare reform, its potential partial or full repeal, and other changes in the healthcare industry and in healthcare spending is currently unknown, and may adversely affect our business model.
- Roxadustat is considered a Class 2 substance on the 2019 World Anti-Doping Agency Prohibited List that could limit sales and increase security and distribution costs for our partners and us.
- · Our employees may engage in misconduct or improper activities, which could result in significant liability or harm our reputation.
- · If we fail to comply with environmental, health or safety laws and regulations, we could incur fines, penalties or other costs.

Risks Related to Our International Operations

- We have established operations in China and are seeking approval to commercialize our product candidates outside of the U.S., and a number of risks associated with international operations could materially and adversely affect our business.
- · The pharmaceutical industry in China is highly regulated and such regulations are subject to change.
- We have limited experience distributing drugs in China.
- We use our own manufacturing facilities in China to produce roxadustat API and drug product. There are risks inherent to operating
 commercial manufacturing facilities, and with these being our single source suppliers, we may not be able to continually meet market
 demand
- As a company, we have limited experience in pharmacovigilance, medical affairs, and management of the third-party distribution logistics, and cannot assure you we will be able to meet regulatory requirements or operate in these capacities successfully.
- We and our collaboration partner in China, AstraZeneca, may experience difficulties in successfully growing and sustaining sales of roxadustat in China.
- · The retail prices of any product candidates that we develop may be subject to pricing control in China and elsewhere.
- FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") would be subject to restrictions on paying dividends or making other payments to us, which may restrict our ability to satisfy our liquidity requirements.
- Any capital contributions from us to FibroGen Beijing must be approved by the Ministry of Commerce in China, and failure to obtain such
 approval may materially and adversely affect the liquidity position of FibroGen Beijing.
- We may be subject to currency exchange rate fluctuations and currency exchange restrictions with respect to our operations in China, which could adversely affect our financial performance.
- Because FibroGen Beijing's funds are held in banks that do not provide insurance, the failure of any bank in which FibroGen Beijing
 deposits its funds could adversely affect our business.
- We may be subject to tax inefficiencies associated with our offshore corporate structure.
- Our foreign operations, particularly those in China, are subject to significant risks involving the protection of intellectual property.
- Uncertainties with respect to the China legal system could have a material adverse effect on us.
- Changes in China's economic, governmental, or social conditions could have a material adverse effect on our business.
- Our operations in China subject us to various Chinese labor and social insurance laws, and our failure to comply with such laws may
 materially and adversely affect our business, financial condition and results of operations.

Risks Related to the Operation of Our Business

Please see below for additional risk factors related to the operation of our Business.

There are also a variety of Risks Related to Our Common Stock

• Please see below for additional risk factors to our Common Stock.

PARTI

ITEM 1. BUSINESS

OVERVIEW

We are a leading biopharmaceutical company discovering, developing and commercializing a pipeline of first-in-class therapeutics. We apply our pioneering expertise in hypoxia-inducible factor ("HIF") biology, 2-oxoglutarate enzymology, and connective tissue growth factor ("CTGF") biology to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer.

Roxadustat, our most advanced product, is an oral small molecule inhibitor of HIF-prolyl hydroxylase ("HIF-PH") activity that acts by stimulating the body's natural pathway of erythropoiesis, or red blood cell production.

We and our collaboration partner AstraZeneca AB ("AstraZeneca") continue to expand the commercialization of roxadustat (tradename: 爱瑞卓®) in the People's Republic of China ("China") where it is approved for the treatment of anemia caused by chronic kidney disease ("CKD") in non-dialysis and dialysis patients. Roxadustat was added to the National Reimbursement Drug List ("NRDL"), effective January 1, 2020. As of the end of 2020, roxadustat was listed at hospitals that represent approximately 70% of the CKD anemia market opportunity in China and we continue to focus on adding additional temporary and permanent hospital listings for roxadustat.

In Japan, our partner Astellas Pharma Inc. ("Astellas") continues the commercial launch of EVRENZO® (roxadustat). Astellas received approval of the supplemental New Drug Application ("NDA") for the use of EVRENZO in patients with anemia of CKD not on dialysis from the Pharmaceuticals and Medical Devices Agency in November 2020, and it is now approved for the treatment of anemia associated with CKD in both non-dialysis and dialysis patients.

With respect to our United States ("U.S.") NDA for roxadustat for the treatment of anemia due to CKD submitted for review in December 2019 to the U.S. Food and Drug Administration ("FDA"), in December 2020, the FDA extended the review period of the NDA by three months for FibroGen to submit additional analyses of existing roxadustat clinical data, and set a new Prescription Drug User Fee Act ("PDUFA") goal date of March 20, 2021. On March 1, 2021, the FDA informed us that the Cardiovascular and Renal Drugs Advisory Committee will hold an advisory committee meeting to review the NDA for roxadustat. The date of the advisory committee meeting has not been set. As a result of this communication, we will not receive an approval decision by the PDUFA goal date.

In May 2020, the Marketing Authorization Application ("MAA") for roxadustat for the treatment of anemia in patients with CKD, submitted by our partner Astellas, was accepted for regulatory review by the European Medicines Agency ("EMA"). Astellas expects an approval decision mid-2021.

EVRENZO® (roxadustat) has also been approved for the treatment of anemia in CKD patients on dialysis and patients not on dialysis in Chile. In collaboration with AstraZeneca, applications for marketing approval of roxadustat in CKD anemia have been submitted in Canada, Australia, Mexico, Brazil, Taiwan, South Korea, Philippines, Singapore, India, Colombia, and Thailand.

Beyond anemia in CKD, roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes ("MDS").

We have completed enrollment in our Phase 2 clinical trial of roxadustat in the U.S. in chemotherapy-induced anemia ("CIA"), and we expect topline data from this study in the second half of 2021.

Pamrevlumab is our first-in-class antibody developed to inhibit the activity of CTGF, a common factor in fibrotic and proliferative disorders characterized by persistent and excessive scarring that can lead to organ dysfunction and failure. Pamrevlumab is in Phase 3 clinical development for the treatment of idiopathic pulmonary fibrosis ("IPF"), locally advanced unresectable pancreatic cancer ("LAPC"), and Duchenne muscular dystrophy ("DMD").

ROXADUSTAT FOR THE TREATMENT OF ANEMIA IN CHRONIC KIDNEY DISEASE

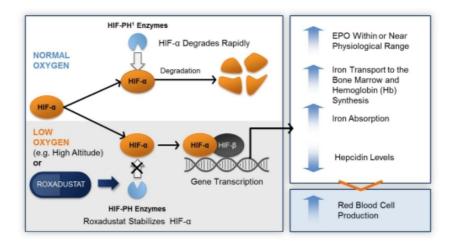

In collaboration with our partners AstraZeneca and Astellas, we have completed 16 Phase 3 studies worldwide in over 11,000 patients to support our regulatory filings in the U.S., Europe, China, and Japan.

After describing the mechanism of action of roxadustat, which is the first in a new class of potential anemia drugs, we provide some background on the CKD anemia market and a summary of our Phase 3 program along with some of the most important results.

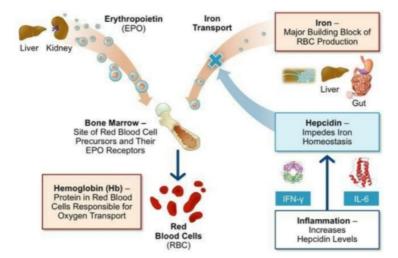

Roxadustat Mechanism of Action

Roxadustat is an orally administered reversible inhibitor of HIF-PH. Inhibition of prolyl hydroxylase stabilizes HIF, which stimulates a coordinated erythropoietic response that includes the increase of plasma endogenous erythropoietin ("EPO") levels and reduction of hepcidin, a key regulator of iron homeostasis. In healthy individuals under normal oxygen conditions, HIF-PH tags HIF-alpha for degradation and the HIF pathway is not activated. However, under low oxygen conditions, the HIF-PH enzymes cannot function and HIF-alpha accumulates. HIF-alpha then combines with HIF-beta, and the newly formed HIF complex initiates transcription of a number of genes involved in the erythropoietic process, which ultimately leads to increased oxygen delivery to tissues.

In anemia of CKD, roxadustat temporarily inhibits HIF-PH, preventing degradation of HIF-alpha and activating the HIF pathway, which stimulates a coordinated erythropoietic response that includes EPO production and the reduction of hepcidin.

The coordinated erythropoiesis activated by roxadustat includes both the stimulation of erythroid maturation, by increasing the body's production of EPO, and an increase in iron availability for hemoglobin synthesis in part through a decrease in hepcidin levels, which is particularly important in patients with inflammation. Patients taking roxadustat typically have a transient increase in circulating endogenous EPO levels at peak concentration within or near the physiologic range naturally experienced by humans adapting to hypoxic conditions such as at high altitude, following blood donation, or impaired lung function, such as pulmonary edema.

By contrast, erythropoiesis stimulating agents ("ESAs") act only to stimulate erythroid maturation without a corresponding increase in iron availability, and are typically dosed at well above the natural physiologic range of EPO. The sudden demand for iron stimulated by ESA-induced erythropoiesis can lead to functional or absolute iron deficiency. We believe these high doses of ESAs are a main cause of the significant safety issues that have been attributed to this class of drugs. In addition, the lack of a coordinated increase in iron availability with ESAs may explain the hyporesponsiveness of patients with inflammation to this class of drugs. It also explains why patients taking ESAs need more IV iron supplementation and red blood cell transfusions than patients taking roxadustat do. Not only are IV iron and blood transfusions more costly than oral iron, but both are also associated with increased risk of hospitalization and death.

The differentiated mechanism of action of roxadustat, which involves induction of the body's own natural pathways to achieve a more complete erythropoiesis, has the potential to provide a safe and effective treatment for anemia, including in the presence of inflammation, which normally limits iron availability.

Background of Anemia in Chronic Kidney Disease

Chronic kidney disease is a progressive disease characterized by gradual loss of kidney function that may eventually lead to kidney failure or end-stage renal disease requiring dialysis or a kidney transplant to survive. CKD affects 12% to 14% of the global adult population. CKD is more prevalent in developed countries but is also growing rapidly in emerging markets such as China.

Anemia is a complication of CKD and can be a serious medical condition in which patients have insufficient red blood cells and low levels of hemoglobin, a protein in red blood cells that carries oxygen to cells throughout the body. Anemia becomes increasingly common as kidney function declines and is associated with increased risk of hospitalization, cardiovascular complications and death, and frequently causes significant fatigue, cognitive dysfunction, and considerable reduction of quality of life.

There are approximately 39 million 1 CKD patients in the U.S., an estimated 6 million of whom have an mia 2 .

When ESAs were introduced in 1989, they dramatically reduced the need for blood transfusions in CKD patients, which was a material development since transfusions reduce the patient's opportunity for a kidney transplant and increase the risk of infections and complications such as heart failure and allergic reactions. However, multiple randomized clinical trials with ESAs suggested safety risks of ESA therapies, and as a result, the anemia guidelines and approved labels have changed to more restrictive use of ESAs.

Bikbov B et al. "Global regional and national burden of chronic kidney disease 1990-2017 - a systematic analysis for the Global Burden of Disease Study 2017." The Lancet, 395 (2020): 709-33. Web. 13 Feb. 2020.

2Based on 15.4% of CKD patients having anemia, (where anemia is defined as hemoglobin levels of \leq 12 g/dL in women and \leq 13 g/dL in men.

In the dialysis-dependent population, most patients start receiving ESAs when the patient is transitioning to dialysis care. As of the end of 2018, there were over 550,000 CKD patients on dialysis in the U.S., a large majority of whom required anemia therapy.

There were approximately 127,000 incident dialysis patients in 2018. Despite the higher risk of blood transfusions, cardiovascular events, and hospitalization in patients with anemia, only 14.6% of patients in 2018 were treated with ESAs prior to initiating dialysis notwithstanding a mean hemoglobin level of 9.3 g/dL at the time of dialysis initiation.

These treatment figures at the time of dialysis initiation demonstrate how undertreated CKD anemia is currently in non-dialysis patients. However, we believe there will be approximately 2 million addressable non-dialysis CKD anemia patients in the U.S. annually, based on the hemoglobin entry criteria in our Phase 3 clinical trials recommending initiation of treatment when a patient's hemoglobin level is less than 10 g/dL. In addition to the safety concerns raised for ESAs, which may have been a greater impediment to treatment in the non-dialysis setting, other factors which contribute to the recent historical under-treatment of anemia in non-dialysis patients are related to the form of administration and accessibility of ESA products. ESAs are typically administered by subcutaneous injections, which is more difficult outside of dialysis centers or nephrology practices where non-dialysis patients are typically treated.

Additional Highlights from Recent Publications and Presentations of Roxadustat in CKD Anemia

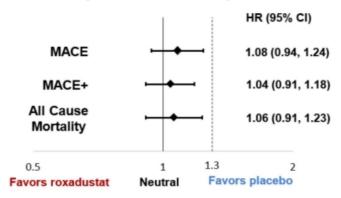

Pooled Cardiovascular Safety Results

In the U.S., the primary safety endpoint is time to first major adverse cardiovascular event ("MACE"), a composite endpoint of all-cause mortality, stroke and myocardial infarction, with secondary safety endpoint of "MACE+", a composite endpoint consisting of the three components in MACE plus heart failure or unstable angina requiring hospitalization. The below cardiovascular safety analyses reflect the pooling strategy and analytical approach that was agreed upon with the FDA and presented in scientific journals/professional meetings.

Non-Dialysis - Pooled Cardiovascular Safety Data

The intent-to-treat analyses, inclusive of data during on-treatment and post treatment long term follow-up (until a common study end date), was used in our primary cardiovascular safety analysis method for non-dialysis in the U.S. This approach accounts for the higher drop-out rate in the placebo arm. The figure below shows that in the 4,270 pooled non-dialysis patients (OLYMPUS, ANDES, and ALPS), the risk of MACE, MACE+, and all-cause mortality in roxadustat patients were comparable to that in placebo patients based on a reference non-inferiority margin of 1.3.

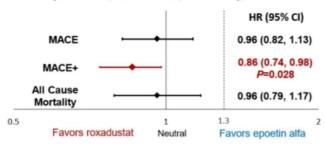

Time to event endpoints using Cox model, ITT analysis NDD (OLYMPUS, ANDES, ALPS), N=4270

Dialysis - Pooled Cardiovascular Safety Data

In the pooled on-treatment analysis of 3,880 dialysis patients (HIMALAYAS, SIERRAS, and ROCKIES), the risk of MACE and all-cause mortality in roxadustat patients were comparable to epoetin alfa, based on a reference non-inferiority margin of 1.3. Roxadustat lowered the risk of MACE+ by 14% compared to epoetin alfa based on a hazard ratio of 0.86 and an upper bound of 95% CI under 1.0. The hazard ratios represent a point estimate of relative risk.

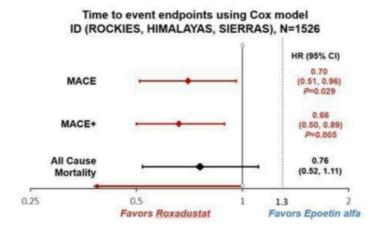

Time to event endpoints using Cox model DE (ROCKIES, HIMALAYAS, SIERRAS), N=3880

Incident Dialysis Subgroup - Pooled Cardiovascular Safety Data

Data from the pooled incident dialysis patients were recently published in Kidney International Reports. (Provenzano R et al. Pooled Analysis of Roxadustat for Anemia in Patients with Kidney Failure Incident to Dialysis. KI Reports 2021. Available at https://www.kireports.org/article/S2468-0249(20)31851-9/fulltext. Accessed on 11FEB2021.)

This is a clinically important subgroup of dialysis patients who started participation in roxadustat Phase 3 studies within their first four months of dialysis initiation. In these 1,526 incident dialysis patients, roxadustat reduced the risk of MACE by 30% and MACE+ by 34%, with a trend towards lower all-cause mortality. The lower MACE and MACE+ risks (compared to epoetin alfa) are based on hazard ratios of 0.70 and 0.66, respectively, with the upper bound of 95% CI under 1.0 for both endpoints. We believe this incident dialysis subpopulation provides clinically and commercially relevant and generalizable results for comparison of roxadustat versus epoetin alfa because most incident dialysis patients (as opposed to stable dialysis patients) were ESA-naïve or had only limited exposure to ESAs prior to study entry. In addition, the initiation of anemia therapy in this incident dialysis subgroup resembles clinical practice as the vast majority of U.S. patients start anemia therapy early in dialysis treatment (during the first four months of treatment).

Iron-Metabolism Data

In non-dialysis patients, roxadustat was effective regardless of whether the "iron-repletion" criteria (ferritin >=100 ng/mL AND TSAT >=20%) were met, including the 40% of patients whose iron stores were below those required for ESA treatment. Roxadustat also increased both serum iron and transferrin, resulting in the long-term clinical stability of TSAT while increasing the absolute amount of iron available for erythropoiesis.

In dialysis patients, roxadustat treated patients required less IV iron supplementation than patients treated with ESA. Roxadustat facilitated iron transport and utilization by increasing both serum iron and iron-carrying capacity (TIBC), whereas these parameters were decreased and unchanged, respectively, with epoetin alfa. We believe these changes were most likely driven by the downstream effects of reduced hepcidin in roxadustat treated patients.

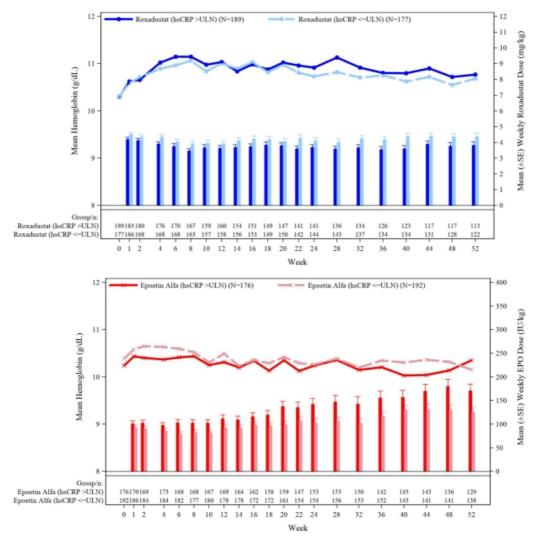

Efficacy at Raising Hemoglobin Irrespective of Iron Replete Status

In the non-dialysis pool (4,277 patients from ANDES, OLYMPUS, and ALPS), roxadustat increased hemoglobin (by 1.94 g/dL) regardless of whether patients were iron-replete (patients shown to have sufficient baseline stores of iron in their body, TSAT \geq 20% and Ferritin \geq 100 ng/mL) or not iron-replete.

Sierras - U.S. Only Dialysis Study

In the U.S. dialysis study SIERRAS, roxadustat raised and maintained Hb levels with stable mean doses over time regardless of baseline inflammation status, as measured by CRP levels. The dose requirement of roxadustat was not impacted by inflammation.

Mean Hb and Mean Weekly Dose of roxadustat (Top Figure) and Epoetin Alfa (Bottom Figure) Over Time in Patients with hsCRP ≤ULN or >ULN (SIERRAS)

hsCRP: high-sensitivity C-reactive protein; SE: standard error; ULN: upper limit of normal.

The proportion of patients who required at least one red blood cell transfusion in the first 52 weeks was 12.5% with roxadustat compared to 21.1% with epoetin alfa (p<0.05) in SIERRAS.

ROXADUSTAT FOR THE TREATMENT OF ANEMIA IN CHRONIC KIDNEY DISEASE IN CHINA

In August 2019, roxadustat (China tradename: 爱瑞卓®) received marketing authorization in China for the treatment of anemia caused by CKD in non-dialysis-dependent patients. Treatment for anemia caused by CKD in dialysis-dependent patients was approved in December 2018.

In July 2019, results from our two China Phase 3 clinical trials were published in the New England Journal of Medicine.3 4

In December 2019, roxadustat was included on the updated NRDL released by China's National Healthcare Security Administration. Roxadustat is included on the NRDL for the treatment of anemia in CKD.

Market Opportunity

The currently available forms of treatment in China for anemia in CKD include ESAs, oral iron, intravenous iron, traditional Chinese medicine, and combinations thereof. ESAs are the largest segment, which we estimate to be approximately \$275 million in sales, or approximately 80% of the total ESA market based on data from IQVIA China Hospital Pharmaceutical Audit. With the unique benefits of roxadustat to treat previously unaddressable patient populations, we believe the overall CKD anemia market will increase.

China is experiencing epidemiological changes in metabolic diseases due to economic development, urbanization and an aging population. Diabetes and hypertension are the leading causes of CKD in China, and rates have been growing over past two decades. We believe the increase in diabetes and hypertension prevalence will result in an increase of CKD anemia patients.

Dialysis-Dependent CKD

Based on the latest estimates and published data, we believe there are over 600,000 dialysis patients in China, making it the largest single-country dialysis population in the world. With the substantial growth rate of dialysis patients (over 10% per year from 2011 to 2017), the Ministry of Health and the Chinese Society of Nephrology have publicly recognized the need for further investment in dialysis infrastructure.

The prevalence of CKD dialysis patients that have anemia (defined as hemoglobin < 10g/dL) is estimated to be over 90%.

Dialysis treatment is delivered in the form of hemodialysis or peritoneal dialysis. In China, approximately 85% of dialysis patients with CKD are on hemodialysis. Hemodialysis is performed primarily in dialysis clinics within hospitals, most of which are publicly owned. This is in contrast to the U.S. where freestanding dialysis centers located outside of hospitals is common practice. With recent regulatory changes, the number of privately owned dialysis clinics is growing at a rapid pace, a trend that has provided additional capacity to meet the growing demand. The remaining 14-15% of CKD patients (approximately 100,000) are on peritoneal dialysis, which is self-administered at home by patients, a setting which roxadustat is particularly well-suited for due to its oral administration. Peritoneal dialysis patients typically visit their nephrologists on a monthly basis at the hospital for monitoring and follow-up.

³N. Chen, et al. "Roxadustat Treatment for Anemia in Patients Undergoing Long-Term Dialysis" N Engl J Med 381 (2019): 1011-22. DOI: 10.1056/NEJMoa1901713

4N. Chen, et al. "Roxadustat for Anemia in Patients with Kidney Disease Not Receiving Dialysis" N Engl J Med 381 (2019): 1001-1010. DOI: 10.1056/NEJMoa1813599

Non-Dialysis-Dependent CKD

We estimate that there are over 10 million Stage 3-5 non-dialysis CKD patients in China with anemia (defined as hemoglobin < 10g/dL). We believe the addressable population of non-dialysis patients with anemia (anemic patients that have been diagnosed and treated for CKD) is approximately 2-3 million, with 1-2 million of these addressable patients in Stages 3 and 4 and 1 million in Stage 5 non-dialysis. This Stage 5 population that is dialysis-eligible but not receiving dialysis is characteristic of developing markets like China, and presents a particular opportunity for roxadustat, as many patients have severe anemia.

Unmet Medical Need and Roxadustat Differentiation in China

We believe there is a particularly significant unmet medical need for the treatment of anemia in CKD in China. Anemia is considered a risk multiplier for CKD patients and is commonly associated with increased rates of cardiovascular events, hospitalizations, CKD progression, and death. Several of the advantages that roxadustat, as an oral therapeutic, potentially offers over ESAs are particularly suited to address the unmet medical need in each of the three categories of CKD patients in China.

We believe there is chronic under-treatment of anemia within the CKD patient population on dialysis in China due in part to under-prescription of IV iron (often necessary for ESA treatment), and lack of efficacy in patients with inflammation. The most recent treatment guidelines published by the Chinese Society of Nephrology in 2018 recommended treatment to hemoglobin 11.0 g/dL to 12.0 g/dL. Even though over 70% of hemodialysis CKD patients, and approximately 60% of peritoneal dialysis CKD patients are treated with ESAs, based on the Chinese Renal Data System in 2015, less than 60% of dialysis patients reached 10.2 g/dL.

In the non-dialysis population and peritoneal dialysis population, only a small percentage of patients receive anemia treatment, and those who do, they receive only a minimal level of treatment, including patients who are eligible for dialysis and who have severe anemia. Roxadustat, as an oral medication, can be easily administered in any setting and stored at room temperature. Injectable drugs like ESAs present a challenge in China because even subcutaneous administration is performed at hospitals and not in the home, in part due to the difficulty in refrigeration and administration of injectable medicines. Frequent hospital visits, for the sole purpose of receiving injectable ESA treatment (as well as IV iron, which is often necessary with ESA treatment), can present a substantial logistical and financial burden to patients.

In the context of the rapidly growing China pharmaceutical market, we believe that the demand for anemia therapy will continue to grow as a result of an expanding CKD population, as well as the central government's mandate to make dialysis more available through government reimbursement and build-out of dialysis facilities. In addition, as the standard of living improves in China, the demand for access to innovative drugs increases. In this context, we believe that roxadustat is a particularly promising product for this market.

Commercialization

AstraZeneca is our commercialization partner for roxadustat in China. Under our collaboration agreement, AstraZeneca leads commercialization activities and has responsibility for sales and marketing, and market access. FibroGen has responsibility for medical affairs, manufacturing (as the Marketing Authorization Holder), and pharmacovigilance.

Pricing and Reimbursement

In December 2019, roxadustat was included for the treatment of anemia in CKD on the updated NRDL released by China's National Healthcare Security Administration. The list is effective for a standard two-year period from January 1, 2020 to December 31, 2021. Roxadustat will be subject to price re-negotiation at the end of 2021.

We believe reimbursement is one of the two most critical market access factors for commercialization success in China, with the other being hospital listings. China is mostly a single-payor market with near universal healthcare provided by the government. Over 95% of the population receives healthcare coverage under one government-funded medical reimbursement plan or another, each with different levels of reimbursement. Commercial health insurance is available but is minimally adopted, and is seen as a supplement above and beyond government reimbursement.

Reimbursement for roxadustat will differ based on multiple factors including the CKD patient population (dialysis vs. non-dialysis), location, patient employment status, and if roxadustat is qualified into the "Critical Disease" or "Chronic Disease" insurance programs for such locations. We expect roxadustat reimbursement rates will be largely consistent with those ESAs listed on the NRDL. We believe in the next few years and in many parts of the country, reimbursement will reach a level where patient out-of-pocket costs will be in the range of 10-20% for dialysis and 30-50% for non-dialysis.

Hospital Listing

Before roxadustat can be prescribed at a government hospital, which is 90% of the market in China, it has to be carried in the hospital formulary. The process of entry into the formulary is commonly referred to as "hospital listing". Decisions are made on a hospital-by-hospital basis, where hospital listing committees meet anywhere from every six months to every five years. Temporary listings can be used in the interim, where the head of the department could place an ad-hoc order with the formulary for a single or handful of patients for small quantities of roxadustat. These market access constraints impact all drugs, not just roxadustat. Consistent with the experience of other product launches in China, significant market uptake is usually seen a few years after launch, although in the case of roxadustat, it could be sooner given the inclusion in NRDL within 12 months of market approval.

Tendering

Tendering is a provincial level procedure. For drugs with multiple brands, it is a collective tender process for purchases by government hospitals of a medicine included in provincial or local medicine procurement catalogs. In the case of roxadustat, it is a more administrative process than for most drugs as roxadustat is currently the only drug of its class (HIF-PHI) available on the market. The tendering process of roxadustat is substantially complete in all 31 provinces in China.

ROXADUSTAT FOR THE TREATMENT OF ANEMIA IN CHRONIC KIDNEY DISEASE IN JAPAN

In Japan, our partner Astellas continues the commercial launch of EVRENZO® (roxadustat), targeting healthcare providers that care for approximately 330,000 dialysis patients across Japan. EVRENZO is now approved for the treatment of anemia associated with CKD in both non-dialysis and dialysis patients. The supplemental NDA for the use of roxadustat in patients with anemia of CKD not on dialysis was approved in November 2020 by the Pharmaceuticals and Medical Devices Agency.

In addition, the 14-day Prescription Rule that is typically in place for the first 12 months of a product's availability in Japan was lifted in December of 2020, creating a potential catalyst for EVRENZO utilization given it is the first HIF-PH inhibitor to no longer have this limitation.

ROXADUSTAT FOR THE TREATMENT OF CHEMOTHERAPY-INDUCED ANEMIA AND ANEMIA ASSOCIATED WITH MYELODYSPLASTIC SYNDROMES

Based on roxadustat's mechanism of action and safety and efficacy profile to date, we believe it has the potential to treat anemia associated with many other conditions, including CIA and MDS.

Background of Chemotherapy-Induced Anemia

As blood cell production in bone marrow is highly prolific, it is particularly vulnerable to the cytotoxic effects of chemotherapy used to treat cancer patients. Many chemotherapy agents directly impair hematopoiesis in bone marrow, including disruption of red blood cell production. The nephrotoxic effects of some cytotoxic agents, such as platinum-containing agents, can also result in decreased production of erythropoietin by the kidneys, further contributing to reduced red blood cell production. Radiation therapy has also been associated with hematologic toxicity.

Approximately 40% of total solid tumor cancer patients, or approximately 6.8 million people, undergo chemotherapy each year globally, including 1.7 million in the U.S. and 3.2 million in China. Between 60% and 80% of these patients develop anemia. The incidence and severity of CIA depend on a variety of factors, including the tumor type or the level of toxicity of the therapy, and further increases with each successive chemotherapy round. We believe the addressable population is approximately 600,000 in the U.S. and 500,000 in China.

ESAs have been recommended for patients experiencing CIA with the desirable goals of improvement in anemia-related symptoms and the avoidance of blood transfusion, which increases risk of infections and the risk of complications such as heart failure and allergic reactions. However, not all CIA patients respond to ESA therapy, which may be due to the etiology of their CIA or inflammatory comorbidity. ESA use also has associated toxicities, including increased thrombotic events, possible decreased survival and accelerated tumor progression, as published from randomized clinical trials and meta-analyses, that led to label restrictions and boxed warnings for ESAs in cancer populations in 2007, followed by the ESA Risk Evaluation and Mitigation Strategy ("REMS") program.

Market Opportunity for Roxadustat in Chemotherapy-Induced Anemia

ESA sales for CIA dropped significantly in the U.S. since the reported safety risks of ESA use in cancer patients in 2006, from estimated \$2.5 billion in 2006 to less than \$0.5 billion in 2019. During the same period, the prevalence of diagnosed CIA remained at similar levels, and is expected to grow slightly.

We believe that if our clinical program shows an acceptable safety and efficacy profile, roxadustat would have the potential to address anemia in this population of patients undergoing chemotherapy.

Clinical Development of Roxadustat in Chemotherapy-Induced Anemia

We have completed enrollment in WHITNEY, our Phase 2 clinical trial of roxadustat in the U.S. in CIA. This is a single-arm open label study investigating the efficacy and safety of roxadustat for the treatment of anemia in 92 patients receiving myelosuppressive chemotherapy treatment for non-myeloid malignancies, with a treatment duration of 16 weeks. We expect topline data from this study in the second half of 2021.

Background of Anemia in Myelodysplastic Syndromes

Myelodysplastic syndromes are a diverse group of bone marrow disorders characterized by ineffective production of healthy blood cells and premature destruction of blood cells in the bone marrow, leading to anemia. In most MDS patients, the cause of the disease is unknown.

The prevalence of MDS in the U.S. is estimated to be between 60,000 and 170,000, and continues to rise as more therapies become available and patients are living longer with MDS. Annual incidence rates are estimated to be 4.9/100,000 adults in the U.S., and 1.51/100,000 adults in China.

Anemia is the most common clinical presentation in MDS, seen in approximately 80% of MDS patients, and producing symptoms, including fatigue, weakness, exercise intolerance, shortness of breath, dizziness, and cognitive impairment.

Limitations of the Current Standard of Care for Anemia in Myelodysplastic Syndromes

Stem cell transplant is the only potentially curative therapy for MDS, but it is not feasible in most patients due to their advanced age and frailty. The high rate of severe anemia leaves recurring red blood cell transfusions as the mainstay of care in MDS patients. Transfusion can result in direct organ damage through transfusional iron overload. Transfusion dependent MDS patients suffer higher rates of cardiac events, infections and transformation to acute leukemia, and a decreased overall survival rate when compared with non-transfused patients with MDS, and decreased survival compared to an age-matched elderly population. Patients receiving red blood cell transfusions may require an iron chelator in order to address toxic elements of iron overload such as lipid peroxidation and cell membrane, protein, DNA, and organ damage.

Lower-risk MDS patients represent approximately 77% of total diagnosed MDS population. Most national and international guidelines recommend use of ESAs for anemia only in lower-risk MDS patients presenting with symptomatic anemia with serum EPO levels at or below 500 mU/mL.

Even among the eligible subpopulation, the effectiveness of ESAs in treating anemia in MDS remains limited, with the best clinical study results showing 40% to 60% erythroid response rates, in studies where significantly high doses of ESAs were used, enrolled patients had low serum EPO levels, and in lower-risk categories. New strategies to broaden the eligible population, improve anemia and maintain adequate iron balance, as well as avoidance of transfusions, are highly desired in managing patients with MDS.

Reblozyl® (luspatercept) was approved by the FDA in April 2020 for the treatment of anemia in adults with MDS with ring sideroblasts or myelodysplastic/myeloproliferative neoplasms with ring sideroblasts and thrombocytosis who need regular red blood cell transfusions and have not responded well to or cannot receive an ESA. It is the first and only erythroid maturation agent approved in the U.S., Europe, and Canada and is part of a global collaboration between Acceleron Pharma, Inc. and Bristol Myers Squibb. In 2020, Reblozyl net revenue was \$274 million, including \$115 million in Q4 2020.

Market Opportunity for Roxadustat in Myelodysplastic Syndromes

We believe there is a significant need for a safer, more effective, and more convenient option to address anemia in patients with lower-risk MDS. Roxadustat, our orally administered small molecule HIF-PH inhibitor, stimulates the body's natural mechanism of red blood cell production and iron hemostasis based on cellular-level oxygen-sensing and iron-regulation mechanisms. Unlike ESAs which are limited to providing exogenous EPO, roxadustat activates a coordinated erythropoietic response in the body that includes the stimulation of red blood cell progenitors, an increase in the body's production of endogenous EPO, and an increase in iron availability for hemoglobin synthesis, which we believe is important in a broad range of MDS patients. Moreover, in anemia of CKD, roxadustat has demonstrated the ability in clinical trials to increase and maintain hemoglobin levels in the presence of inflammation as measured by CRP, where ESAs have shown limited effect. We believe that roxadustat has the potential to replicate this result in MDS anemia patients, where it is not uncommon for patients to present with autoimmune and inflammatory conditions.

Clinical Development of Roxadustat in Myelodysplastic Syndromes

We are continuing to enroll MATTERHORN, our Phase 3 placebo controlled, double-blind clinical trial to evaluate the safety and efficacy of roxadustat for treatment of anemia in MDS in the U.S. and Europe. This 160-patient trial is studying roxadustat in transfusion-dependent, lower-risk MDS patients, in which subjects are randomized 3:2 to receive roxadustat or placebo three-times-weekly. The primary endpoint is the proportion of patients who achieve transfusion independence by 28 weeks with secondary endpoints and safety evaluated at 52 weeks. We expect topline data from this study in the first half of 2022.

In the open-label dose-finding component of this study, 24 lower-risk, transfusion dependent MDS patients with anemia were enrolled in three sequential starting dose cohorts (1.5 mg/kg, 2.0 mg/kg, and 2.5 mg/kg), with roxadustat doses adjusted every eight weeks per a pre-defined algorithm based on hemoglobin response. Best supporting care including red blood cell transfusion was allowed, as needed, per investigator's discretion. Patients treated with roxadustat achieved a greater than or equal to 8-week transfusion independence rate of 38% in the first 28 weeks and 54% of patients had greater than or equal to 50% reduction in red blood cell transfusion over any eight weeks, from baseline. Roxadustat was generally well tolerated in each dose cohort. The dose level of 2.5 mg/kg was selected as the starting dose for the double-blind component of the study.

In China, we are preparing to enroll the Phase 3 double-blind, placebo-controlled portion of our Phase 2/3 clinical trial to evaluate the safety and efficacy of roxadustat in non-transfusion dependent, lower-risk MDS patients with anemia. One hundred thirty-five subjects will be randomized 2:1 to receive roxadustat or placebo three-times weekly for 26 weeks. The primary endpoint for this study is percentage of patients achieving a hemoglobin response.

PAMREVLUMAB FOR THE TREATMENT OF FIBROSIS AND CANCER

We were founded to discover and develop therapeutics for fibrosis and began studying CTGF shortly after its discovery. Our accumulated discovery research efforts indicate that CTGF is a critical common element in the progression of serious diseases associated with fibrosis.

From our library of human monoclonal antibodies that bind to different parts of the CTGF protein and block various aspects of CTGF biological activity, we selected pamrevlumab, for which we have exclusive worldwide rights. We believe that pamrevlumab blocks CTGF and inhibits its central role in causing diseases associated with fibrosis. Our data to date indicate that pamrevlumab is a promising and highly differentiated product candidate with broad potential to treat a number of fibrotic diseases and cancers.

We are currently conducting Phase 3 studies in pancreatic cancer, IPF and DMD. In the U.S., the FDA has granted Orphan Drug Designation to pamrevlumab for the treatment of IPF, LAPC, and DMD. In addition, the EMA has granted Orphan Medicinal Product Designation to pamrevlumab for the treatment of DMD. Pamrevlumab has also received Fast Track designation from the FDA for the treatment of both IPF and LAPC.

Overview of Fibrosis

Fibrosis is an aberrant response of the body to tissue injury that may be caused by trauma, inflammation, infection, cell injury, or cancer. The normal response to injury involves the activation of cells that produce collagen and other components of the extracellular matrix ("ECM") that are part of the healing process. This healing process helps to fill in tissue voids created by the injury or damage, segregate infections or cancer, and provide strength to the recovering tissue. Under normal circumstances, where the cause of the tissue injury is limited, the scarring process is self-limited and the scar resolves to approximate normal tissue architecture. However, in certain disease states, this process is prolonged and excessive and results in progressive tissue scarring, or fibrosis, which can cause organ dysfunction and failure as well as, in the case of certain cancers, promote cancer progression.

Excess CTGF levels are associated with fibrosis. CTGF increases the abundance of myofibroblasts, a cell type that drives wound healing, and stimulates them to deposit ECM proteins such as collagen at the site of tissue injury. In the case of normal healing of a limited tissue injury, myofibroblasts eventually die by programmed cell death, or apoptosis, and the fibrous scarring process recedes.

Multiple biological agents and pathways have been implicated in the fibrotic process, many of which converge on CTGF, a central mediator of fibrosis. In the case of cancer, the sustained tumor-associated fibrotic tissue promotes tumor cell survival and metastasis. CTGF is a secreted glycoprotein produced by fibroblasts, endothelium, mesangial cells and other cell types, including cancers, and is induced by a variety of regulatory modulators, including TGF-\(\theta\) and VEGF. CTGF expression has been demonstrated to be up-regulated in fibrotic tissues. Thus, we believe that targeting CTGF to block or inhibit its activity could mitigate, stop or reverse tissue fibrosis. In addition, since CTGF is implicated in nearly all forms of fibrosis, we believe pamrevlumab has the potential to provide clinical benefit in a wide range of clinical indications that are characterized by fibrosis.

Until recently, it was believed that fibrosis was an irreversible process. It is now generally understood that the process is dynamic and potentially amenable to reversal. Based on studies in animal models of fibrosis of the liver, kidney, muscle and cardiovascular system, it has been shown that fibrosis can be reversed. It has also been demonstrated in humans that fibrosis caused by hepatitis virus can be reversed (Chang et al. Hepatology (2010)). Additionally, we have generated data in human and animal studies that lung fibrosis progression can be slowed, arrested, or possibly reversed in some instances upon treatment with pamrevlumab.

Clinical Development of Pamrevlumab - Overview

We have performed clinical trials of pamrevlumab in IPF, pancreatic cancer, liver fibrosis and diabetic kidney disease. In eleven Phase 1 and Phase 2 clinical studies involving pamrevlumab to date, including more than 600 patients who were treated with pamrevlumab (about half of patients dosed for more than six months), pamrevlumab has been well-tolerated across the range of doses studied, and there have been no dose-limiting toxicities seen thus far.

Idiopathic Pulmonary Fibrosis

Understanding IPF and Current Therapies

IPF is a form of progressive pulmonary fibrosis, or abnormal scarring, which destroys the structure and function of the lungs. As tissue scarring progresses in the lungs, transfer of oxygen into the bloodstream is increasingly impaired. Average life expectancy at the time of confirmed diagnosis of IPF is estimated to be between three to five years, with approximately two-thirds of patients dying within five years of diagnosis. Thus, the survival rates are comparable to some of the most deadly cancers. The cause of IPF is unknown but is believed to be related to unregulated cycles of injury, inflammation and fibrosis.

Patients with IPF experience debilitating symptoms, including shortness of breath and difficulty performing routine functions, such as walking and talking. Other symptoms include chronic dry, hacking cough, fatigue, weakness, discomfort in the chest, loss of appetite, and weight loss. Over the last decade, refinements in diagnosis criteria and enhancements in high-resolution computed tomography imaging technology ("quantitative HRCT") have enabled more reliable diagnosis of IPF without the need for a lung biopsy.

The U.S. prevalence and incidence of IPF are estimated to be 44,000 to 135,000 cases, and 21,000 new cases per year, respectively, based on Raghu et al. (Am J Respir Crit Care Med (2006)) and on data from the United Nations Population Division. We believe that with the availability of technology to enable more accurate diagnoses, the number of individuals diagnosed per year with IPF will continue to increase.

There are currently two therapies approved to treat IPF in Europe and the U.S., pirfenidone and nintedanib. The approvals and subsequent launches of Esbriet (pirfenidone) and Ofev (nintedanib) have clearly shown the commercial potential in IPF. Hoffmann-La Roche ("Roche") reported worldwide sales of approximately \$1.1 billion for 2019 and \$1.2 billion for 2020 for Esbriet® (pirfenidone). Similarly, Boehringer Ingelheim Pharma GmbH & Co. KG ("Boehringer Ingelheim") reported total sales of approximately \$1.3 billion for Ofev® (nintedanib) in 2018, and approximately \$1.7 billion in 2019.

Phase 3 Clinical Development - Randomized, Double-Blind, Placebo-Controlled Trials of Pamrevlumab in IPF

We are conducting ZEPHYRUS-1, our Phase 3 trial of pamrevlumab in IPF patients, as well as our newly initiated ZEPHYRUS-2, a second IPF Phase 3 study. Both studies are double-blind, placebo-controlled Phase 3 trials targeting approximately 340 patients, each with a primary U.S. efficacy endpoint of change from baseline in forced vital capacity.

The primary efficacy endpoint in Europe for each study is disease progression (defined by a decline in forced vital capacity ("FVC") percent predicted of greater than or equal to 10% or death). Secondary endpoints will include clinical outcomes of disease progression, patient reported outcomes, and quantitative changes in lung fibrosis volume from baseline.

The COVID-19 pandemic has affected enrollment in these IPF trials, more so than our other studies due to the vulnerability of this patient population. In addition to efforts we are making in ensuring patient safety, we are also working to expand enrollment through a number of methods, including expanding the number of clinical sites in China.

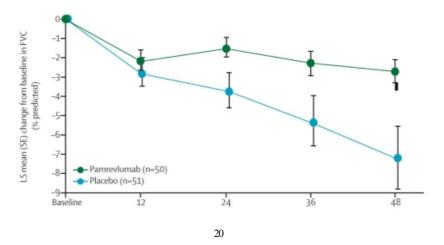

PRAISE - Study 067 - Randomized, Double-Blind, Placebo-Controlled Phase 2 Trial of Pamrevlumab in IPF

In September 2019, positive results from PRAISE, our randomized, double-blind, placebo-controlled Phase 2 clinical trial (Study 067), were published in *The Lancet Respiratory Medicine*. PRAISE was designed to evaluate the safety and efficacy of pamrevlumab in patients with mild-to-moderate IPF (baseline FVC percentage predicted of 55%), as well as topline results from two sub-studies that were added to evaluate the safety of combining pamrevlumab with approved IPF therapies.

In the double-blind, placebo-controlled 48-week portion of this study, 103 patients were randomized (1:1) to receive either 30mg/kg of pamrevlumab or placebo intravenously every three weeks. Lung function assessments were conducted at baseline and at Weeks 12, 24, 36 and 48. Quantitative HRCT assessments were performed at baseline and at Weeks 24 and 48.

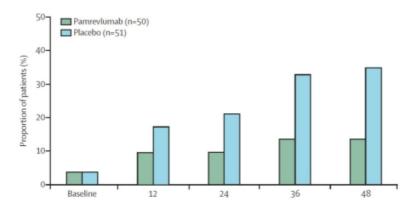

Pamrevlumab met the primary efficacy endpoint of change of FVC percent predicted, a measure of a patient's lung volume as a percentage of what would be expected for such patient's age, race, sex and height. The average decline (least squares mean) in FVC percent predicted from baseline to Week 48 was 2.9 in the pamrevlumab arm (n=50) as compared to an average decline of 7.2 in the placebo arm (n=51), a statistically significant difference of 4.33 (p=0.033).

FVC Change by Visit

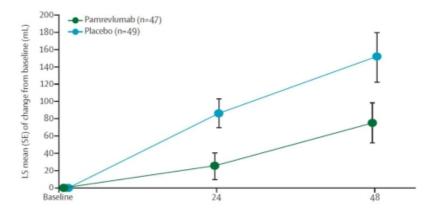

Pamrevlumab-treated patients had an average decrease (least squares mean) in FVC of 129 ml at Week 48 compared to an average decrease of 308 ml in patients receiving placebo, a statistically significant difference of 178 ml (p=0.0249, using a linear slope analysis in the intent-to-treat population). This represents a 57.9% relative difference. In addition, the pamrevlumab-treated arm had a lower proportion of patients (10%) who experienced disease progression (defined by a decline in FVC percent predicted of greater than or equal to 10% or death), than did the placebo arm (31.4%) at Week 48 (p=0.0103).

Proportion of Patients with Decline in Percentage of Predicted FVC of 10% or Greater, or Death, by Visit

In this study, we measured change in quantitative lung fibrosis ("QLF") from baseline to Week 24 and Week 48 using quantitative HRCT. The pamrevlumab arm achieved a statistically significant reduction in the rate of progression of lung fibrosis compared to placebo using HRCT to measure QLF. The change in QLF volume from baseline to Week 24 for pamrevlumab-treated patients was 24.8 ml vs. 86.4 ml for placebo, with a treatment difference of -61.6 ml, p=0.009. The change in QLF volume from baseline to 48 weeks was 75.4 ml in pamrevlumab-treated patients vs. 151.5 ml in patients on placebo, with a treatment difference of -76.2 ml, p=0.038.

Change from Baseline in Volume of Quantitative Lung Fibrosis (mL) in the Intention-to-Treat Population

As in our previous open label Phase 2 study, a correlation between FVC percent predicted and QLF was confirmed at both Week 24 and 48 in this study.

We are not aware of any other IPF therapies that have shown a statistically significant effect on lung fibrosis as measured by quantitative HRCT analysis.

The treatment effects of pamrevlumab were demonstrated not only on change in FVC, a measure of pulmonary function and IPF disease progression, and change in fibrosis using quantitative HRCT, but pamrevlumab-treated patients also showed a trend of clinically meaningful improvement in a measure of health-related quality of life using the St. George's Respiratory Questionnaire (SGRQ) vs. a reduction in quality of life seen in placebo patients over the 48 weeks of treatment. The SGRQ quality of life measurement has been validated in chronic obstructive pulmonary disease. In the patients that were evaluated by the UCSD Shortness of Breath Questionnaire, pamrevlumab-treated patients had a significant attenuation of their worsening dyspnea in comparison to placebo patients.

Pamrevlumab was well-tolerated in the placebo-controlled study. The treatment-emergent adverse events were comparable between the pamrevlumab and placebo arms and the adverse events in the pamrevlumab arm were consistent with the known safety profile of pamrevlumab. In this study, as compared with the placebo group, fewer pamrevlumab patients were hospitalized, following an IPF-related or respiratory treatment-emergent adverse event, or died for any reason.

The double-blind, active-controlled combination sub-studies were designed to assess the safety of combining pamrevlumab with standard of care medication in IPF patients. Study subjects were on stable doses of pirfenidone or nintedanib for at least three months and were randomized 2:1 to receive 30 mg/kg of pamrevlumab or placebo every three weeks for 24 weeks. Thirty-six patients were enrolled in the pirfenidone sub-study and 21 patients were enrolled in the nintedanib sub-study. Pamrevlumab appeared to be well-tolerated when given in combination with either pirfenidone or nintedanib.

Study 049 - Open-Label Phase 2 Trial of Pamrevlumab in IPF

Our completed open-label extension of Study 049, a Phase 2 open-label, dose-escalation study to evaluate the safety, tolerability, and efficacy of pamrevlumab in 89 patients with IPF, was consistent with our results from our randomized, double-blind, placebo-controlled Phase 2 clinical trial PRAISE. We presented data from our open-label Phase 2 IPF extension study (049) at the International Colloquium on Lung and Airway Fibrosis in November 2016, reporting that no safety issues were observed during prolonged treatment with pamrevlumab. Some of the 37 patients who enrolled in the extension study were treated with pamrevlumab for up to five years. Trends regarding improved or stable pulmonary function and stable fibrosis observed during the initial one-year study were also observed in the extension study.

Pancreatic Cancer

Understanding Pancreatic Cancer and the Limitations of Current Therapies

Certain solid malignant tumors have a prominent fibrosis component consisting mostly of ECM that contributes to metastasis and progressive disease. ECM is the connective tissue framework of an organ or tissue.

Pancreatic ductal adenocarcinoma, or pancreatic cancer, is the third leading cause of cancer deaths in the U.S. According to the European Commission's European Cancer Information System, there were 100,005 new cases of pancreatic cancer and 95,373 deaths from pancreatic cancer in Europe projected for 2018. The National Cancer Center of Japan estimated that there were 36,239 new cases of pancreatic cancer in 2014, increased from 24,442 cases in 2004. In its report of December 2017, Decision Resources Group estimated that the major market sales (U.S., Europe and Japan) of pancreatic cancer drugs will grow from \$1.3 billion in 2016 to approximately \$3.7 billion in 2026. According to the U.S. National Cancer Institute, there were an estimated 57,000 new cases of pancreatic cancer in the U.S. in 2019. Fifty percent of new cases are metastatic. Another 15-20% have localized resectable tumors. The remaining 30-35% have localized but unresectable tumors.

For those with non-resectable tumors, median survival is eight to 12 months post-diagnosis, and about 8% realize five years of survival; similar to metastatic cases. For those with resectable tumors, 50% survive 17 to 27 months post-diagnosis and ~20% report five-year survival.

Pancreatic cancer is aggressive and typically not diagnosed until it is largely incurable. Most patients are diagnosed after the age of 45, and according to the American Cancer Society, 94% of patients die within five years from diagnosis. The majority of patients are treated with chemotherapy, but pancreatic cancer is highly resistant to chemotherapy. Approximately 15% to 20% of patients are treated with surgery; however, even for those with successful surgical resection, the median survival is approximately two years, with a five-year survival rate of 15% to 20% (Neesse et al. Gut (2011)). Radiation treatment may be used for locally advanced diseases, but it is not curative.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 602 of 1730

The duration of effect of approved anti-cancer agents to treat pancreatic cancer is limited. Gemcitabine demonstrated improvement in median overall survival from approximately four to six months, and erlotinib in combination with gemcitabine demonstrated an additional ten days of survival. Nab-paclitaxel in combination with gemcitabine was approved by the FDA in 2013 for the treatment of pancreatic cancer, having demonstrated median survival of 8.5 months. The combination of folinic acid, 5-fluorouracil, irinotecan and oxaliplatin (FOLFIRINOX) was reported to increase survival to 11.1 months from 6.8 months with gemcitabine. These drugs illustrate that progress in treatment for pancreatic cancer has been modest, and there remains a need for substantial improvement in patient survival and quality of life.

The approved chemotherapeutic treatments for pancreatic cancer target the cancer cells themselves. Tumors are composed of cancer cells and associated non-cancer tissue, or stroma, of which ECM is a major component. In certain cancers such as pancreatic cancer, both the stroma and tumor cells produce CTGF which in turn promotes the proliferation and survival of stromal and tumor cells. CTGF also induces ECM deposition that provides advantageous conditions for tumor cell adherence and proliferation, promotes blood vessel formation, or angiogenesis, and promotes metastasis, or tumor cell migration, to other parts of the body.

Pancreatic cancers are generally resistant to powerful chemotherapeutic agents, and there is now growing interest in the use of an anti-fibrotic agent to diminish the supportive role of stroma in tumor cell growth and metastasis. The anti-tumor effects observed with pamrevlumab in preclinical models indicate that it has the potential to inhibit tumor expansion through effects on tumor cell proliferation and apoptosis as well as reduce metastasis.

Phase 3 Clinical Development - Randomized, Double-Blind, Placebo-Controlled Trial of Pamrevlumab in Locally Advanced, Unresectable Pancreatic Cancer

We continue to enroll LAPIS, our double-blind placebo controlled Phase 3 clinical program for pamrevlumab as a neoadjuvant therapy for LAPC. We intend to enroll approximately 260 patients, randomized at a 1:1 ratio to receive either pamrevlumab or placebo, in each case in combination with gemcitabine and nab-paclitaxel. We expect topline resection data from this study in the second half of 2022.

Study 069 - Randomized, Open-Label, Active-Controlled Phase 1/2 Trial of Pamrevlumab in Locally Advanced Pancreatic Cancer

We continue to follow patients in our ongoing open-label, randomized (2:1) Phase 1/2 trial (FGC004C-3019-069) of pamrevlumab combined with gemcitabine plus nab-paclitaxel chemotherapy vs. the chemotherapy regimen alone in patients with inoperable locally advanced pancreatic cancer that has not been previously treated. We enrolled 37 patients in this study and completed the six-month treatment period and surgical assessment at the end of 2017. The overall goal of the trial is to determine whether the pamrevlumab combination can convert inoperable pancreatic cancer to operable, or resectable, cancer. Tumor removal is the only chance for cure of pancreatic cancer, but only approximately 15% to 20% of patients are eligible for surgery.

We reported updated results from this ongoing study at the American Society of Clinical Oncology Annual Meeting in June 2018. A higher proportion (70.8%) of pamrevlumab-treated patients whose tumors were previously considered unresectable became eligible for surgical exploration than patients who received chemotherapy alone (15.4%), based on pre-specified eligibility criteria at the end of 6 months of treatment. Furthermore, a higher proportion of pamrevlumab-treated patients (33.3%) achieved surgical resection than those who received chemotherapy alone (7.7%).

In addition, this data showed improved overall survival among patients whose tumors were resected vs. not resected (NE vs. 18.56 months, p-value=0.0141) and a trend toward improved overall survival in patients eligible for surgery vs. patients who were not (27.73 vs. 18.40 months, p-value=0.0766). All of the patients on study at the time of the results reported in June 2018 continue to remain on study. No increase in serious adverse events was observed in the pamrevlumab arm and no delay in wound healing was observed post-surgery.

Patients with LAPC have median survival of less than 12 months, only slightly better than patients with metastatic pancreatic cancer, whereas patients with resectable pancreatic cancer have a much better prognosis with median survival of approximately 23 months and some patients being cured. If pamrevlumab in combination with chemotherapy continues to demonstrate an enhanced rate of conversion from unresectable cancer to resectable cancer, it may support the possibility that pamrevlumab could provide a substantial survival benefit for locally advanced pancreatic cancer patients.

Completed Clinical Trials of Pamrevlumab in Pancreatic Cancer

We completed an open-label Phase 1/2 (FGCL-MC3019-028) dose finding trial of pamrevlumab combined with gemcitabine plus erlotinib in patients with previously untreated locally advanced (Stage 3) or metastatic (Stage 4) pancreatic cancer. These study results were published in the *Journal of Cancer Clinical Trials* (Picozzi et al., J Cancer Clin Trials 2017, 2:123). Treatment continued until progression of the cancer or the patient withdrew for other reasons. Patients were then followed until death.

Seventy-five patients were enrolled in this study with 66 (88%) having Stage 4 metastatic cancer. The study demonstrated a dose-related increase in survival. At the lowest doses, no patients survived for even one year while at the highest doses up to 31% of patients survived one year.

A post-hoc analysis found that there was a significant relationship between survival and trough levels of plasma pamrevlumab measured immediately before the second dose (Cmin), as illustrated below. Cmin greater than or equal to $150~\mu g/mL$ was associated with significantly improved progression-free survival (p=0.01) and overall survival (p=0.03) vs. those patients with Cmin less than $150~\mu g/mL$. For patients with Cmin >150 $\mu g/mL$ median survival was 9.0 months compared to median survival of 4.4 months for patients with Cmin <150 $\mu g/mL$. Similarly, 34.2% of patients with Cmin >150 $\mu g/mL$ survived for longer than one year compared to 10.8% for patients with Cmin <150 $\mu g/mL$. These data suggest that sufficient blockade of CTGF requires pamrevlumab threshold blood levels of approximately $150~\mu g/mL$ in order to improve survival in patients with advanced pancreatic cancer.

Increased Pancreatic Cancer Survival Associated with Increased Plasma Levels of Pamrevlumab

The Kaplan-Meier plot provides a representation of survival of all patients in the clinical trial. Each vertical drop in the curve represents a recorded event (death) of one or more patients. When a patient's event cannot be determined either because he or she has withdrawn from the study or because the analysis is completed before the event has occurred, that patient is "censored" and denoted by a symbol (•) on the curve at the time of the last reliable assessment of that patient.

Overall Survival Time (Months)

In the study, the majority of adverse events were mild to moderate, and were consistent with those observed for erlotinib plus gemcitabine treatment without pamrevlumab. There were 99 treatment-emergent serious adverse events; six of which were assessed as possibly related to the investigational drug by the principal investigator, and 93 as not related to study treatment. After investigation, it is our belief that there is no causal relationship between pamrevlumab and the treatment-emergent serious adverse events deemed possibly related by the principal investigator. We did not identify any evolving dose-dependent pattern, and higher doses of pamrevlumab were not associated with higher numbers of serious adverse events or greater severity of the serious adverse events observed.

Pamrevlumab for Duchenne Muscular Dystrophy

Understanding DMD and the Limitations of Current Therapies

In the U.S., approximately one in every 5,000 boys have DMD, and approximately 20,000 children are diagnosed with DMD globally each year. There are currently no approved disease-modifying treatments. Despite taking steroids to mitigate progressive muscle loss, a majority of children with DMD are non-ambulatory by adolescence and median survival is age 25.

DMD is an inherited disorder of one of the dystrophin genes resulting in absence of the dystrophin protein and abnormal muscle structure and function, leading to progressively diminished mobility as well as pulmonary function and cardiac function, which result in early death. Constant myofiber breakdown results in persistent activation of myofibroblasts and altered production of ECM resulting in extensive fibrosis in skeletal muscles of DMD patients. Desguerre et al. (2009) showed that muscle fibrosis was the only myo-pathologic parameter that significantly correlated with poor motor outcome as assessed by quadriceps muscle strength, manual muscle testing of upper and lower limbs, and age at ambulation loss. Numerous pre-clinical studies including those in the mdx model of DMD suggest that CTGF contributes to the process by which muscle is replaced by fibrosis and fat and that CTGF may also impair muscle cell differentiation during muscle repair after injury.

Phase 3 Clinical Development - LELANTOS, a double-blind, placebo-controlled trial in non-ambulatory DMD patients

In the third quarter of 2020, we initiated a Phase 3 clinical trial, LELANTOS 1, evaluating pamrevlumab as a treatment for DMD. LELANTOS 1 is a double-blind, placebo-controlled trial in approximately 90 non-ambulatory DMD patients. Patients will be randomized at a 1:1 ratio to pamrevlumab or placebo and have a treatment period of 52 weeks. The primary endpoint will assess change in upper limb strength and additional endpoints will include pulmonary, performance, cardiac, and fibrosis assessments.

We also plan to initiate a Phase 3 clinical trial, LELANTOS 2, evaluating pamrevlumab in 70 ambulatory DMD patients.

We expect topline data from these studies in the second half of 2022.

Phase 2 Open-Label Trial of Pamrevlumab in DMD

In June 2019 at the Parent Project Muscular Dystrophy meeting, we reported topline results from this 21 patient open-label single-arm trial in non-ambulatory DMD patients. This one-year administrative analysis compared our Phase 2 data to previously published natural disease history studies of DMD patients. While we cannot make direct comparisons between our trial and previously published data due to, among other things, differences in subject numbers, baseline characteristics, inclusion/exclusion criteria, treatment protocols, and analysis methods, we are encouraged by the data obtained so far. Pamrevlumab was well tolerated in this study.

In pulmonary function tests, the results from our study indicate a potential reduction in the 1-year decline in FVC percent predicted from baseline for pamrevlumab-treated patients when compared to FVC data of DMD patients (whether such patients were taking steroids or not) published in 2019 by Ricotti. In the 2019 Ricotti study, the DMD patients were treated with steroids only. Similarly, all of the patients in our Phase 2 pamrevlumab trial were on steroids. In addition, pamrevlumab showed less decline in both percent predicted forced expiratory volume as compared to previously published study results of Meier in 2016, and in percent predicted peak expiratory flow rate, compared to what was observed in the study by Ricotti in 2019

Our data showed an increase in cardiac function, measured by mean change of left ventricular ejection fraction ("LVEF"), of 0.29% from baseline for pamrevlumab-treated patients. Whereas, data published in 2018 by McDonald of DMD patients only on steroids showed a mean LVEF decline of 0.82% from baseline in one year.

In muscle function tests, the majority of the results of this Phase 2 study showed the mean change from baseline in pamrevlumab-treated patients were more favorable than previously published data. Our results showed a positive increase in grip-strength score in both dominant and non-dominant hands at one year of treatment with pamrevlumab, while earlier results from a 2015 study by Seferian showed a decline at one year as expected. In the performance of the upper limb ("PUL") test specifically developed for DMD patients, pamrevlumab-treated patients had a mean change from baseline of -1.53. In the 2019 study by Ricotti of DMD patients taking either nothing or only steroids, the annual mean change in the PUL test was -4.13. Furthermore, in our study a strong correlation between change in biceps brachii T2-mapping and change in PUL score was observed, demonstrating stabilization and even possible improvement in the muscle fibrosis burden.

Commercialization Strategy for Pamrevlumab

Our goal, if pamrevlumab is successful, is to be a leader in the development and commercialization of novel approaches for inhibiting fibrosis and treating certain forms of cancer and muscular dystrophy diseases. To date, we have retained exclusive worldwide rights for pamrevlumab. We have commenced brand development activities for pamrevlumab and will be advancing these efforts in preparation for potential launches in IPF, LAPC and DMD, consistent with the approaches of companies with a product in late-stage clinical development.

Research at FibroGen

Our research programs at FibroGen are grounded in our three areas of expertise: HIF biology, 2-oxoglutarate enzymology, and CTGF biology.

We have applied our expertise in the field of HIF-PH inhibition to develop an understanding of other areas of HIF biology with important therapeutic implications. This consistent progression of discovery has led to findings relating to HIF-mediated effects associated with inflammatory pathways, various aspects of iron metabolism, insulin sensitivity and glucose and fat metabolism, neurological disease, and ischemic injury. There are at least three different HIF-PH enzymes that are known to regulate the stability of HIF - these enzymes are commonly referred to in the scientific literature as PHD1, PHD2 and PHD3. Studies of genetically modified mice, in which the individual HIF-PH enzymes have been deleted, have revealed that PHD2 plays a major role in the regulation of erythropoiesis by HIF. In contrast, PHD1 and PHD3 appear to play less important roles in HIF-mediated erythropoiesis, but instead have been implicated in other important biological pathways. We believe that both pan-PHD and PHD-selective inhibitors could have important therapeutic applications beyond anemia.

The HIF-PH enzymes that are the targets of roxadustat belong to a broader family of enzymes known as 2-oxoglutarate (2OG)-dependent oxygenases. In humans, this family comprises more than 60 members that play important roles in a diverse range of biological processes including collagen biosynthesis, oxygen sensing, epigenetic regulation, nucleic acid modification/repair, and lipid metabolism. The first members of this enzyme family to be characterized were the collagen prolyl hydroxylases, which play a critical role in the biosynthesis of collagen and as a result, are potential targets for the treatment of fibrotic disease. Other members of the 2OG-dependent oxygenase family with relevance to human disease include the Jumonji domain-containing histone demethylases, which are emerging cancer targets.

The fact that all members of the 2OG-dependent oxygenase enzyme family use 2OG as a co-substrate makes them viable targets for small molecule inhibitors that compete with 2OG. FibroGen has been a leader in inhibition of enzymes belonging to this family, and our internal medicinal chemistry efforts have generated a library of novel compounds designed to target the 2OG-dependent oxygenase family.

Finally, we have applied our knowledge of CTGF to investigate additional applications of agents that interfere with the role of this protein in disease. In some instances, we are exploring direct engagement of CTGF itself. In other instances, we are studying the regulation of CTGF.

COLLABORATIONS

Our revenue to date has been generated primarily from our collaboration agreements with Astellas and AstraZeneca for the development and commercialization of roxadustat. In addition, we started roxadustat commercial sales in China in the third quarter of 2019. For fiscal year ended December 31, 2020, 58% of our revenue was related to our collaboration agreements, and 42% of our revenue was from roxadustat commercial sales in China. For the fiscal years ended December 31, 2019 and 2018, substantially all of our revenue was related to our collaboration agreements.

Astellas

We have two agreements with Astellas for the development and commercialization of roxadustat, one for Japan, and one for Europe, the Commonwealth of Independent States, the Middle East and South Africa. Under these agreements, we provided Astellas the right to develop and commercialize roxadustat for anemia in these territories.

We share responsibility with Astellas for clinical development activities required for U.S. and Europe regulatory approval of roxadustat, and share equally those development costs under the agreed development plan for such activities. Astellas will be responsible for clinical development activities and all associated costs required for regulatory approval in all other countries in the Astellas territories. Astellas will hold and have responsibility for regulatory filings in its territories. We are responsible, either directly or through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements, other than roxadustat drug product for Japan. Astellas is responsible for roxadustat commercialization activities in the Astellas territories.

AstraZeneca

We also have two agreements with AstraZeneca for the development and commercialization of roxadustat for anemia, one for China (the "China Agreement"), and one for the U.S. and all other countries not previously licensed to Astellas (the "U.S./RoW Agreement"). Under these agreements, we provided AstraZeneca the right to develop and commercialize roxadustat for anemia in these territories. We share responsibility with AstraZeneca for clinical development activities required for U.S. regulatory approval of roxadustat, and FibroGen will transfer the U.S. NDA to AstraZeneca upon approval. AstraZeneca will hold the equivalent regulatory filings in the other licensed countries.

In China, our subsidiary FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") has conducted the development work for CKD anemia and will continue to hold all of the regulatory licenses issued by China regulatory authorities and be primarily responsible for regulatory, clinical and manufacturing. China development costs are shared 50/50. AstraZeneca is also responsible for 100% of development expenses in all other licensed territories outside of China. We are responsible, ourselves and through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the AstraZeneca agreements.

Under the China Agreement, which is conducted through FibroGen China Anemia Holdings, Ltd. ("FibroGen Cayman"), FibroGen Beijing, and FibroGen International (Hong Kong) Limited (collectively, "FibroGen China"), the commercial collaboration is structured as a 50/50 profit share, which was restructured in the third quarter of 2020. Pursuant to an Amendment to the China Agreement, the parties agreed to establish a jointly owned entity to conduct distribution. FibroGen Beijing will manufacture and transfer commercial product to the distribution entity in exchange for a transfer price at a percentage of net sales. AstraZeneca will conduct sales and marketing activities in China for roxadustat, which will be billed to the distribution entity, subject to a cap of a percentage of roxadustat net sales until AstraZeneca has recouped its sales and marketing expenses, at which time it will bill actual expenses, subject to the cap.

Additional Information Related to Collaboration Agreements

Additional information related to our collaboration agreements is set forth in Item 7 of this Annual Report on Form 10-K, and Note 4, *Collaboration Agreements and Revenues*, to our consolidated financial statements under Item 8 of this Annual Report. Information about collaboration partners that accounted for more than 10% of our total revenue or accounts receivable for the last three fiscal years is set forth in Note 15, *Segment and Geographic Information*, to our consolidated financial statements under Item 8 of this Annual Report.

COMPETITION

The pharmaceutical and biotechnology industries are highly competitive, particularly in some of the indications we are developing drug candidates, including anemia in CKD, IPF, pancreatic cancer, and DMD. We face competition from multiple other pharmaceutical and biotechnology companies, many of which have significantly greater financial, technical and human resources and experience in product development, manufacturing and marketing. These potential advantages of our competitors are particularly a risk in IPF, pancreatic cancer, and DMD, where we do not currently have a development or commercialization partner.

We expect any products that we develop and commercialize to compete based on, among other things, efficacy, safety, convenience of administration and delivery, price, the level of generic competition, and the availability of reimbursement from government and other third-party payors.

When any of our product candidates are approved, they will compete with currently marketed products, and product candidates that may be approved for marketing in the future, for treatment of the indications described below.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 607 of 1730

In addition, we will likely face competition from other companies developing treatments of other anemia indications that we may also seek to pursue in the future or that may be sold in indications we are pursuing but for which they are not yet approved. We may face competition for patient recruitment, enrollment for clinical trials, and potentially in commercial sales. There may also be new therapies for renal-related diseases that could limit the market or level of reimbursement available for roxadustat.

Roxadustat

Approved Medicines

Drugs that will compete with roxadustat are expected to include ESAs, particularly in those patient segments where ESAs are used. Some of the available ESAs include epoetin alfa (EPOGEN® marketed by Amgen Inc. in the U.S., Procrit® and Erypo®/Eprex®, marketed by Johnson & Johnson, Inc. and Espo® marketed by Kyowa Hakko Kirin in Japan and China), darbepoetin (Amgen/Kyowa Hakko Kirin's Aranesp® and NESP®) and Mircera® marketed by Roche outside the U.S. and by Vifor Pharma, a Roche licensee, in the U.S. and Puerto Rico, as well as biosimilar versions of these currently marketed ESA products. ESAs have been used in the treatment of anemia in CKD for more than 30 years, serving a significant majority of dialysis patients. While non-dialysis CKD anemia patients who are not under the care of nephrologists, including those with diabetes and hypertension, do not typically receive ESAs and are often left untreated, some patients under nephrology or hematology care may be receiving ESA therapy. It may be difficult to encourage healthcare providers and patients to switch to roxadustat from products with which they have become familiar.

Biosimilars

The first biosimilar ESA, Pfizer's Retacrit® (epoetin zeta), entered the U.S. market in November 2018. Market penetration of Retacrit and the potential addition of other biosimilar ESAs currently under development may alter the competitive and pricing landscape of anemia therapy in CKD patients on dialysis under the end-stage renal disease bundle. The patients for Amgen's EPOGEN® (epoetin alfa) expired in 2004 in Europe, and the final material patients in the U.S. expired in May 2015. Several biosimilar versions of currently marketed ESAs are available for sale in Europe, China and other territories. In the U.S., a few ESA biosimilars are currently under development. Sandoz, a division of Novartis, markets Binocrit® (epoetin alfa) in Europe and may file a biosimilar Biologics License Application in the U.S.

Product Candidates in Development

We may also face competition from potential new anemia therapies currently in clinical development, including in those patient segments not adequately addressed by ESAs. Companies that are currently developing HIF-PH inhibitors for anemia in CKD indications include GlaxoSmithKline plc ("GSK"), Bayer Corporation ("Bayer"), Akebia Therapeutics, Inc. ("Akebia"), Otsuka Pharmaceutical ("Otsuka"), Akebia's partner in the U.S. and Europe, Japan Tobacco, and Zydus Cadila (India) ("Zydus"). Akebia has completed Phase 3 studies in CKD patients on dialysis and not on dialysis in the U.S., as well as a Phase 3b, randomized, open-label, active-controlled trial evaluating the efficacy and safety of oral vadadustat once daily and three times weekly for the maintenance treatment of anemia in hemodialysis subjects converting from erythropoiesis stimulating agents. The study completion date is estimated to be May 2022. Akebia announced an additional Phase 3 study evaluating the efficacy and safety of dose conversion from a long-acting erythropoiesis stimulating agent (Mircera®) to three times weekly oral vadadustat for the maintenance treatment of anemia in hemodialysis subjects. The estimated study start date is February 2021. Akebia has publicly stated their intent to file the vadadustat NDA in the U.S. in the second quarter of 2021.

Japan

In Japan, Mitsubishi Tanabe Pharmaceutical Corporation, Akebia's collaboration partner, received approval for vadadustat on June 29, 2020 for the treatment of anemia of CKD patients on and not on dialysis. GSK received approval for daprodustat in Japan on June 29, 2020 for the treatment of anemia of CKD patients on and not on dialysis. Price listing for the launch in Japan of both vadadustat and daprodustat occurred in the third quarter of 2020, with pricing in line with roxadustat pricing. GSK is also conducting global Phase 3 studies in CKD patients on dialysis and not on dialysis, and expects to complete those studies by March 2022. GSK and Kyowa Hakko Kirin announced in November 2018 that the two companies signed a strategic commercialization deal in Japan for daprodustat. Bayer has completed global Phase 2 studies and its HIF-PH inhibitor is now in Phase 3 development in CKD populations on dialysis and not on dialysis in Japan. Japan Tobacco received approval in Japan for enarodustat for the treatment of anemia in CKD patients on dialysis and not on dialysis, to be sold by Torii Pharmaceuticals Ltd as ENAROY®. Japan Tobacco and its partner JW Pharmaceuticals started a Phase 3 study in dialysis patients in Korea in 2019. Zydus started Phase 3 studies in dialysis and non-dialysis CKD patients in India in 2019.

China

In China, biosimilars of epoetin alfa are offered by Chinese pharmaceutical companies such as EPIAO marketed by 3SBio Inc. as well as more than 15 other local manufacturers. We may also face competition by HIF-PH inhibitors from other companies such as Akebia, Bayer, and GSK, which was authorized by the National Medical Products Administration ("NMPA") to conduct trials in China to support its ex-China regulatory filings. Two domestic companies, Jiangsu Hengrui Medicine Co., Ltd. and Guandong Sunshine Health Investment Co., Ltd, have been permitted by the NMPA to conduct clinical trials for CKD anemia patients both on dialysis and not on dialysis, and 3SBio Inc. has submitted a clinical trial application to the NMPA to initiate trials for their HIF-PH inhibitor. Another domestic company, China Medical System Holdings Ltd., in-licensed desidustat, a compound that is currently in Phase 3 trials in India, from Zydus for greater China in January 2020. In January 2021, China Medical System Holdings Ltd. was granted approval by the NMPA in China to begin trials for desidustat in patients with anemia of CKD, including dialysis and non-dialysis patients. Shenzhen Salubris Pharmaceutical Co., Ltd., a domestic company in China, has in-licensed enarodustat from Japan Tobacco and received NMPA approval in the third quarter of 2020 to initiate Phase 3 studies. Akebia announced in April 2017 an expansion of their U.S. collaboration with Otsuka to add markets, including China. 3SBio Inc. announced in 2016 its plan to begin a Phase 1 clinical trial of a HIF-PH inhibitor for the China market.

CIA and MDS

In July 2020, Zydus received approval from the FDA to begin a Phase 1 study of desidustat for the treatment of CIA, which could potentially be competitive with roxadustat within this indication.

Reblozyl® (luspatercept) was approved by the FDA in April 2020 for the treatment of anemia in adults with MDS with ring sideroblasts or myelodysplastic/myeloproliferative neoplasms with ring sideroblasts and thrombocytosis who need regular red blood cell transfusions and have not responded well to or cannot receive an ESA. It is the first and only erythroid maturation agent approved in the U.S., Europe, and Canada and is part of a global collaboration between Acceleron Pharma, Inc. and Bristol Myers Squibb. In 2020, Reblozyl net revenue was \$274 million, including \$115 million in O4 2020.

Large Dialysis Organizations

The majority of the current CKD anemia market focuses on dialysis patients, who visit dialysis centers on a regular basis, typically three times a week, and anemia therapies are administered as part of the visit. Two of the largest operators of dialysis clinics in the U.S., DaVita Healthcare Partners Inc. ("DaVita"), and Fresenius Medical Care AG & Co. KGaA ("Fresenius"), collectively provide dialysis care to more than 80% of U.S. dialysis patients, and therefore have historically secured long-term contracts including rebate terms with Amgen. DaVita has a six-year sourcing and supply agreement with Amgen effective through 2022. Fresenius' contract with Amgen expired in 2015, following which Fresenius is providing Roche's ESA Mircera® to a significant portion of its U.S. dialysis patients. Successful penetration in this market may require our partner AstraZeneca to enter into an agreement with Fresenius, DaVita, or other dialysis organizations, on favorable pricing terms to each party.

Pamrevlumab

We are currently in Phase 3 development of pamrevlumab in IPF, locally advanced pancreatic cancer, and DMD. Most of our competitors have significantly more resources and expertise in development, commercialization and manufacturing, particularly due to the fact that we have not yet established a partnership for pamrevlumab. For example, both Roche and Boehringer Ingelheim, which market products for the treatment of IPF in the U.S., have successfully developed and commercialized drugs in various indications and have built sales organizations that we do not currently have; both have more resources and more established relationships when competing with us for patient recruitment and enrollment for clinical trials or, if we are approved, in the market.

Idiopathic Pulmonary Fibrosis

If approved and launched commercially to treat IPF, pamrevlumab is expected to compete with Roche's Esbriet® (pirfenidone), and Boehringer Ingelheim's Ofev® (nintedanib). We believe that if pamrevlumab can be shown to safely stabilize or reverse lung fibrosis, and thus stabilize or improve lung function in IPF patients, it can compete with pirfenidone and nintedanib for market share in IPF. However, it may be difficult to encourage treatment providers and patients to switch to pamrevlumab from a product with which they are already familiar. We may also face competition from potential new IPF therapies in recruitment and enrollment in our clinical trials and potentially in commercialization.

Pamrevlumab is administered via infusion, which may be more expensive and less convenient than small molecules such as nintedanib and pirfenidone. Other potential competitive product candidates in various stages of development for IPF include Kadmon Holdings, Inc.'s KD025, Liminal BioSciences' PBI-4050, and Roche/Promedior, Inc.'s PRM-151.

Pancreatic Cancer

We are developing pamrevlumab to be used in combination with Abraxane® (nab-paclitaxel) and gemcitabine in pancreatic cancer. Celgene's Abraxane was launched in the U.S. and Europe in 2013 and 2014, respectively, and was the first drug approved in this disease in nearly a decade. In 2015, Merrimack Pharmaceuticals Inc. ("Merrimack") received FDA approval for the use of ONIVYDE (irinotecan liposome injection, now licensed to Ipsen) for the treatment of patients with metastatic adenocarcinoma of the pancreas after disease progression following gemcitabine-based therapy, and the combination therapy with Abraxane and gemcitabine became the first-line standard of care in these patients. As treatments for pancreatic cancer have shown limited success to date, combination therapies are expected, but the incremental cost may slow a new product adoption in the market, at least until the generic versions of Abraxane becomes available. In addition, we may also face competition from other products seeking approval in conjunction with gemcitabine and Abraxane including FOLFRINOX, a combination chemotherapy regimen of folic acid, 5-fluouracil, oxaliplatin and irinotecan, Rafael Pharma's defactinib/CPI-613, and Merrimack's istiratumab.

Duchenne Muscular Dystrophy

If approved and launched commercially to treat DMD, pamrevlumab is expected to face competition from drugs that have been approved in major markets such as the U.S., European Union, and Japan.

On September 19, 2016, the FDA approved Sarepta Therapeutics Inc.'s ("Sarepta") Exondys 51TM (eteplirsen). Exondys 51 is approved to treat patients who have a mutation of the dystrophin gene amenable to exon 51 skipping, representing approximately 13% of patients with DMD. In Europe, Sarepta received a negative opinion for its marketing application for eteplirsen from the EMA in September 2018. Sarepta has reported a full year Exondys 51 revenue of \$380 million in 2019. Sarepta's Vyondys 53TM (golodirsen) was approved by the FDA in December 2019 for patients with a confirmed genetic mutation that is amenable to exon 53 skipping, which accounts for approximately 8% of the DMD population. Sarepta's Amondys 45TM (casimersen) was approved by the FDA in February 2021 for patients with a confirmed genetic mutation that is amenable to exon 45 skipping, which accounts for approximately 8% of the DMD population.

PTC Therapeutics' product Translarna TM received a conditional approval in Europe in 2014, which was renewed in November 2016 with a request for a new randomized placebo-controlled 18-month study by the Committee for Medicinal Products for Human Use of the EMA; however, the FDA informed the sponsor in a complete response letter in October 2017, as well as in its response to PTC Therapeutics' appeal, that the FDA is unable to approve the application in its current form. While Translarna TM targets a different set of DMD patients from those targeted by Sarepta's Exondys 51®, it is also limited to a subset of patients who carry a specific mutation. Conversely, pamrevlumab is intended to treat DMD patients without limitation to type of mutation.

Pamrevlumab may also face competition from other drugs currently in clinical development in patient recruiting and enrollment in clinical trials, and, if approved, in commercialization. Examples of those compounds currently under clinical development are the drug candidates from Catabasis Pharmaceuticals, Santhera Pharmaceuticals, and Sarepta.

MANUFACTURE AND SUPPLY

We have historically and in the future plan to continue to enter into contractual arrangements with qualified third-party manufacturers to manufacture and package our products and product candidates. We believe that this manufacturing strategy enables us to more efficiently direct financial resources to the research, development and commercialization of product candidates rather than diverting resources to establishing a significant internal manufacturing infrastructure, unless there is additional strategic value for establishing manufacturing capabilities, such as in China. As our product candidates proceed through development, we explore or enter into longer term commercial supply agreements with key suppliers and manufacturers in order to meet the ongoing and planned clinical and commercial supply needs for ourselves and our partners. Our timing of entry into these agreements is based on the current development and commercialization plans.

Roxadustat

Roxadustat is a small-molecule drug manufactured from generally available commercial starting materials and chemical technologies and multipurpose equipment available from many third party contract manufacturers. We have entered into commercial supply arrangements with Shanghai
SynTheAll Pharmaceutical Co., Ltd. ("WuXi STA") and Catalent, Inc. ("Catalent") as our primary manufacturers of roxadustat drug substance (also
known as active pharmaceutical ingredient or "API") and roxadustat drug product, respectively. WuXi STA is located in China and currently
supplies our API globally except for China, for which it manufactures an intermediate to be further manufactured by FibroGen Beijing. WuXi STA
has passed inspections by several regulatory agencies, including the FDA and NMPA, and is Current Good Manufacturing Practice ("cGMP")
compliant. Catalent is located in the U.S. and supplies our drug product tablets globally except for Japan, where they are manufactured by Astellas,
and China, where they are manufactured by FibroGen Beijing. Catalent has passed several regulatory inspections, including by the FDA, and
manufactures commercial products for other clients.

In China, our Beijing facility received the Good Manufacturing Practice ("GMP") license for API and drug product. We are manufacturing drug product at our FibroGen Beijing manufacturing facility for commercial supply, but we are not currently manufacturing API at this facility. We are manufacturing API at our Cangzhou manufacturing facility, which has been fully qualified and licensed. We may also qualify a third party manufacturer to produce commercial API under the Marketing Authorization Holder System program.

Irix Pharmaceuticals, Inc.

In July 2002, we and IRIX Pharmaceuticals, Inc. ("IRIX"), a third party manufacturer, entered into a Letter of Agreement for IRIX Pharmaceuticals Single Source Manufacturing Agreement (the "Letter of Agreement"), in connection with a contract manufacturing arrangement for clinical supplies of HIF-PH inhibitors, including roxadustat. The Letter of Agreement contained a service agreement that included terms and schedule for the delivery of clinical materials and also included a term sheet for a single source agreement for the cGMP manufacture of HIF-PH inhibitors, including roxadustat. Specifically, pursuant to the Letter of Agreement, we and IRIX agreed to negotiate a single source manufacturing agreement that included a first right to negotiate a manufacturing contract for HIF-PH inhibitors, including roxadustat, provided that IRIX is able to match any third party bids within 5%, and the exclusive right to manufacture extends for five years after approval of an NDA. Any agreement would provide that no minimum amounts would be specified until appropriate by forecast, that we and our commercialization partner would have the rights to contract with independent third parties that exceed IRIX's internal capabilities or in the event that we or our commercialization partner determines for reasons of continuity and security that such a need exists, provided that IRIX would supply a majority of the product if it is able to meet the requirements and the schedule required by us and our partner. Subsequent to the Letter of Agreement, IRIX and we have entered into several additional service agreements. IRIX has requested in writing that we honor the Letter of Agreement with respect to the single source manufacturing agreement. To date, we have offered to IRIX opportunities to bid for the manufacture of HIF-PH inhibitors, including roxadustat. In 2015, Patheon Pharmaceuticals Inc., a business unit of DPx Holdings B.V., acquired IRIX, and in 2017 ThermoFisher Scientific Inc. acquired Patheon

Pamrevlumab

To date, pamrevlumab has been manufactured using specialized biopharmaceutical process techniques under a clinical supply agreement with a qualified third party contract manufacturer, Boehringer Ingelheim. We have entered into a clinical and commercial supply agreement for the manufacture of pamrevlumab with Samsung Biologics Co., Ltd., which has passed several regulatory inspections, including by the FDA, and manufactures commercial products for other clients.

GOVERNMENT REGULATION

Our business activities and operations, including the clinical testing, manufacturing, labeling, storage, distribution, record keeping, advertising, promotion, import, export and marketing of our product candidates, among other things, are subject to extensive regulation by governmental authorities in the U.S., China, and other countries. The process of obtaining regulatory approvals and the subsequent compliance with appropriate federal, state, local and foreign statutes and regulations, including in Europe and China, requires the expenditure of substantial time and financial resources. Compliance with environmental laws, rules, and regulations has not had, and is not expected to have, a material effect on our capital expenditures, results of operations, or competitive position, and we do not currently anticipate material capital expenditures for environmental control facilities.

Failure to comply with the applicable requirements at any time during the product development process, approval process or after approval may subject an applicant and/or sponsor to a variety of administrative or judicial sanctions, including refusal by the applicable regulatory authority to approve pending applications, withdrawal of an approval, imposition of a clinical hold, issuance of warning letters and other types of letters, product recalls, product seizures, total or partial suspension of production or distribution, injunctions, fines, refusals of government contracts, restitution, disgorgement of profits, or civil or criminal investigations and penalties brought by FDA and the Department of Justice, or other governmental entities.

We cannot predict with certainty whether future costs of compliance with government regulations, including any changes thereto or reinterpretations thereof, will have a material impact on capital expenditures, earnings or the company's competitive position. Refer to the section of this Annual Report captioned "Item 1A. Risk Factors" for a discussion of these potential impacts.

U.S. Product Approval Process

In the U.S., the FDA regulates drugs and biological products, or biologics, under the Public Health Service Act, as well as the FDCA, which is the primary law for regulation of drug products. Both drugs and biologics are subject to the regulations and guidance implementing these laws. Pharmaceutical products are also subject to regulation by other governmental agencies, such as the Federal Trade Commission, the Office of Inspector General of the U.S. Department of Health and Human Services, the Consumer Product Safety Commission and the Environmental Protection Agency. The clinical testing, manufacturing, labeling, storage, distribution, record keeping, advertising, promotion, import, export and marketing, among other things, of our product candidates are subject to extensive regulation by governmental authorities in the U.S. and other countries. The steps required before a drug or biologic may be approved for marketing in the U.S. generally include:

- Preclinical laboratory tests and animal tests conducted under Good Laboratory Practices.
- The submission to the FDA of an IND for human clinical testing, which must become effective before each human clinical trial commence.
- Adequate and well-controlled human clinical trials to establish the safety and efficacy of the product and conducted in accordance with good clinical practices ("GCP").
- The submission to the FDA of an NDA, in the case of a small molecule drug product, or a BLA, in the case of a biologic product.
- FDA acceptance, review and approval of the NDA or BLA, as applicable.
- Satisfactory completion of an FDA inspection of the manufacturing facilities at which the product is made to assess compliance with cGMPs.

The testing and approval process requires substantial time, effort and financial resources, and the receipt and timing of any approval is uncertain. The FDA may suspend clinical trials at any time on various grounds, including a finding that the subjects or patients are being exposed to a potentially unacceptable health risk.

Preclinical studies include laboratory evaluations of the product candidate, as well as animal studies to assess the potential safety and efficacy of the product candidate. Preclinical studies must be conducted in compliance with FDA regulations regarding GLPs. The results of the preclinical studies, together with manufacturing information and analytical data, are submitted to the FDA as part of the IND, which includes the results of preclinical testing and a protocol detailing, among other things, the objectives of the clinical trial, the parameters to be used in monitoring safety and the effectiveness criteria to be evaluated if the first phase or phases of the clinical trial lends themselves to an efficacy determination. The IND will become effective automatically 30 days after receipt by the FDA, unless the FDA raises concerns or questions about the conduct of the trials as outlined in the IND prior to that time. In this case, the IND sponsor and the FDA must resolve any outstanding concerns before clinical trials can proceed. The IND must become effective before clinical trials may be commenced.

Clinical trials involve the administration of the product candidates to healthy volunteers, or subjects, or patients with the disease to be treated under the supervision of a qualified principal investigator. Clinical trials must be conducted under the supervision of one or more qualified principal investigators in accordance with GCPs and in accordance with protocols detailing the objectives of the applicable phase of the trial, dosing procedures, research subject selection and exclusion criteria and the safety and effectiveness criteria to be evaluated. Progress reports detailing the status of clinical trials must be submitted to the FDA annually. Sponsors must also timely report to the FDA serious and unexpected adverse events, any clinically important increase in the rate of a serious suspected adverse event over that listed in the protocol or investigator's brochure, or any findings from other studies or tests that suggest a significant risk in humans exposed to the product candidate. Further, the protocol for each clinical trial must be reviewed and approved by an independent institutional review board ("IRB"), either centrally or individually at each institution at which the clinical trial will be conducted. The IRB will consider, among other things, ethical factors, and the safety of human subjects and the possible liability of the institution.

Clinical trials are typically conducted in three sequential phases prior to approval, but the phases may overlap and different trials may be initiated with the same drug candidate within the same phase of development in similar or different patient populations. These phases generally include the following:

Phase 1. Phase 1 clinical trials represent the initial introduction of a product candidate into human subjects, frequently healthy volunteers. In Phase 1, the product candidate is usually tested for pharmacodynamic and pharmacokinetic properties such as safety, including adverse effects, dosage tolerance, absorption, distribution, metabolism and excretion.

Phase 2. Phase 2 clinical trials usually involve studies in a limited patient population to (1) evaluate the efficacy of the product candidate for specific indications, (2) determine dosage tolerance and optimal dosage and (3) identify possible adverse effects and safety risks.

Phase 3. If a product candidate is found to be potentially effective and to have an acceptable safety profile in Phase 2 studies, the clinical trial program will be expanded to Phase 3 clinical trials to further evaluate clinical efficacy, optimal dosage and safety within an expanded patient population at geographically dispersed clinical study sites.

Phase 4. Phase 4 clinical trials are conducted after approval to gain additional experience from the treatment of patients in the intended therapeutic indication and to document a clinical benefit in the case of drugs approved under accelerated approval regulations, or when otherwise requested by the FDA in the form of post-market requirements or commitments. Failure to promptly conduct any required Phase 4 clinical trials could result in withdrawal of approval.

The results of preclinical studies and clinical trials, together with detailed information on the manufacture, composition and quality of the product candidate, are submitted to the FDA in the form of an NDA (for a drug) or BLA (for a biologic), requesting approval to market the product. The application must be accompanied by a significant user fee payment. The FDA has substantial discretion in the approval process and may refuse to accept any application or decide that the data is insufficient for approval and require additional preclinical, clinical or other studies.

Review of Application

Once the NDA or BLA submission has been accepted for filing, which occurs, if at all, 60 days after submission, the FDA informs the applicant of the specific date by which the FDA intends to complete its review. This is typically 12 months from the date of submission. The review process is often extended by FDA requests for additional information or clarification. The FDA reviews NDAs and BLAs to determine, among other things, whether the proposed product is safe and effective for its intended use, and whether the product is being manufactured in accordance with cGMP to assure and preserve the product's identity, strength, quality and purity. Before approving an NDA or BLA, the FDA may inspect the facilities at which the product is manufactured and will not approve the product unless the manufacturing facility complies with cGMPs and will also inspect clinical trial sites for integrity of data supporting safety and efficacy. During the approval process, the FDA also will determine whether a REMS, is necessary to assure the safe use of the product. If the FDA concludes a REMS is needed, the sponsor of the application must submit a proposed REMS; the FDA will not approve the application without an approved REMS, if required. A REMS can substantially increase the costs of obtaining approval. The FDA may also convene an advisory committee of external experts to provide input on certain review issues relating to risk, benefit and interpretation of clinical trial data. The FDA may delay approval of an NDA if applicable regulatory criteria are not satisfied and/or the FDA requires additional testing or information. The FDA may require post-marketing testing and surveillance to monitor safety or efficacy of a product. FDA will issue either an approval of the NDA or BLA or a complete response letter detailing the deficiencies and information required in order for reconsideration of the application.

Pediatric Exclusivity and Pediatric Use

Under the Best Pharmaceuticals for Children Act, certain drugs or biologics may obtain an additional six months of exclusivity in an indication, if the sponsor submits information requested in writing by the FDA ("Written Request"), relating to the use of the active moiety of the drug or biologic in children. The FDA may not issue a Written Request for studies on unapproved or approved indications or where it determines that information relating to the use of a drug or biologic in a pediatric population, or part of the pediatric population, may not produce health benefits in that population.

We have not received a Written Request for such pediatric studies with respect to our product candidates, although we may ask the FDA to issue a Written Request for studies in the future. To receive the six-month pediatric market exclusivity, we would have to receive a Written Request from the FDA, conduct the requested studies in accordance with a written agreement with the FDA or, if there is no written agreement, in accordance with commonly accepted scientific principles, and submit reports of the studies. A Written Request may include studies for indications that are not currently in the labeling if the FDA determines that such information will benefit the public health. The FDA will accept the reports upon its determination that the studies were conducted in accordance with and are responsive to the original Written Request, agreement, or commonly accepted scientific principles, as appropriate, and that the reports comply with the FDA's filing requirements.

In addition, the Pediatric Research Equity Act ("PREA") requires a sponsor to conduct pediatric studies for most drugs and biologicals, for a new active ingredient, new indication, new dosage form, new dosing regimen or new route of administration. Under PREA, original NDAs, BLAs and supplements thereto must contain a pediatric assessment unless the sponsor has received a deferral or waiver. The required assessment must include the evaluation of the safety and effectiveness of the product for the claimed indications in all relevant pediatric subpopulations and support dosing and administration for each pediatric subpopulation for which the product is safe and effective. The FDA, on its own initiative or at the request of the sponsor, may request a deferral of pediatric studies for some or all of the pediatric subpopulations. A deferral may be granted by FDA if they believe that additional safety or effectiveness data in the adult population needs to be collected before the pediatric studies begin. After April 2013, the FDA must send a non-compliance letter to any sponsor that fails to submit the required assessment, keep a deferral current or fails to submit a request for approval of a pediatric formulation.

Post-Approval Requirements

Even after approval, drugs and biologics manufactured or distributed pursuant to FDA approvals are subject to continuous regulation by the FDA, including, among other things, requirements relating to recordkeeping, periodic reporting, product distribution, advertising and promotion and reporting of adverse experiences with the product. After approval, most changes to the approved product, such as adding new indications or other labeling claims are subject to prior FDA review and approval. There also are continuing, annual user fee requirements for any marketed products and the establishments at which such products are manufactured, as well as new application fees for supplemental applications with clinical data.

The FDA may impose a number of post-approval requirements as a condition of approval of an NDA or BLA. For example, the FDA may require post-marketing testing, including Phase 4 clinical trials, and surveillance to further assess and monitor the product's safety and effectiveness after commercialization.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 614 of 1730

In addition, entities involved in the manufacture and distribution of approved drugs and biologics are required to register their establishments with the FDA and state agencies, and are subject to periodic unannounced inspections by the FDA and these state agencies for compliance with cGMP requirements. Changes to the manufacturing process are strictly regulated and often require prior FDA approval before being implemented. FDA regulations also require investigation and correction of any deviations from cGMP and impose reporting and documentation requirements upon the sponsor and any third-party manufacturers that the sponsor may decide to use. Accordingly, manufacturers must continue to expend time, money, and effort in the area of production and quality control to maintain cGMP compliance.

Once an approval is granted, the FDA may withdraw the approval if compliance with regulatory requirements and standards is not maintained or if problems occur after the product reaches the market. Later discovery of previously unknown problems with a product, including adverse events of unanticipated severity or frequency, or with manufacturing processes, or failure to comply with regulatory requirements, may also result in revisions to the approved labeling to add new safety information; imposition of post-market studies or clinical trials to assess new safety risks; or imposition of distribution or other restrictions under a REMS program. Other potential consequences include, among other things:

- · Restrictions on the marketing or manufacturing of the product, complete withdrawal of the product from the market or product recalls.
- Fines, warning letters or holds on post-approval clinical trials.
- Refusal of the FDA to approve pending NDAs or BLAs or supplements to approved NDAs or BLAs, or suspension or revocation of
 product license approvals.
- Product seizure or detention, or refusal to permit the import or export of products.
- Injunctions or the imposition of civil or criminal penalties.

The FDA strictly regulates marketing, labeling, advertising and promotion of products that are placed on the market. Drugs may be promoted only for the approved indications and in accordance with the provisions of the approved label. The FDA and other agencies actively enforce the laws and regulations prohibiting the promotion of off-label uses, and a company that is found to have improperly promoted off-label uses may be subject to significant liability.

Prescription Drug Marketing Act

The distribution of pharmaceutical products is subject to the Prescription Drug Marketing Act ("PDMA"), which regulates the distribution of drugs and drug samples at the federal level and sets minimum standards for the registration and regulation of drug distributors at the state level. Under the PDMA and state law, states require the registration of manufacturers and distributors who provide pharmaceuticals in that state, including in certain states manufacturers and distributors who ship pharmaceuticals into the state even if such manufacturers or distributors have no place of business within the state. The PDMA and state laws impose requirements and limitations upon drug sampling to ensure accountability in the distribution of samples. The PDMA sets forth civil and criminal penalties for violations of these and other provisions.

Federal and State Fraud and Abuse and Data Privacy and Security and Transparency Laws and Regulations

In addition to FDA restrictions on marketing of pharmaceutical products, federal and state healthcare laws restrict certain business practices in the biopharmaceutical industry. These laws include, but are not limited to, anti-kickback, false claims, data privacy and security, and transparency statutes and regulations.

The federal Anti-Kickback Statute prohibits, among other things, knowingly and willfully offering, paying, soliciting or receiving remuneration, directly or indirectly, to induce, or in return for, purchasing, leasing, ordering or arranging for the purchase, lease or order of any good, facility, item or service reimbursable under Medicare, Medicaid or other federal healthcare programs. The term "remuneration" has been broadly interpreted to include anything of value, including for example, gifts, discounts, the furnishing of supplies or equipment, credit arrangements, payments of cash, waivers of payment, ownership interests and providing anything at less than its fair market value. The Anti-Kickback Statute has been interpreted to apply to arrangements between pharmaceutical manufacturers on one hand and prescribers, purchasers and formulary managers on the other. Although there are a number of statutory exemptions and regulatory safe harbors protecting certain common activities from prosecution, the exemptions and safe harbors are drawn narrowly, and our practices may not in all cases meet all of the criteria for a statutory exception or safe harbor protection. Practices that involve remuneration that may be alleged to be intended to induce prescribing, purchases or recommendations may be subject to scrutiny if they do not qualify for an exception or safe harbor. Failure to meet all of the requirements of a particular applicable statutory exception or regulatory safe harbor does not make the conduct per se illegal under the Anti-Kickback Statute. Instead, the legality of the arrangement will be evaluated on a case-by-case basis based on a cumulative review of all of its facts and circumstances. Several courts have interpreted the statute's intent requirement to mean that if any one purpose of an arrangement involving remuneration is to induce referrals of federal healthcare covered business, the statute has been violated. The intent standard under the Anti-Kickback Statute was amended by the Patient Protection and Affordable Care Act as amended by the Health Care and Education Reconciliation Act of 2010 (collectively "PPACA"), to a stricter intent standard such that a person or entity no longer needs to have actual knowledge of this statute or the specific intent to violate it in order to have committed a violation. In addition, PPACA codified case law that a claim including items or services resulting from a violation of the federal Anti-Kickback Statute constitutes a false or fraudulent claim for purposes of the civil False Claims Act (discussed below). Further, civil monetary penalties statute imposes penalties against any person or entity who, among other things, is determined to have presented or caused to be presented a claim to a federal health program that the person knows or should know is for an item or service that was not provided as claimed or is false or fraudulent.

The federal false claims laws prohibit, among other things, any person or entity from knowingly presenting, or causing to be presented, a false or fraudulent claim for payment or approval to the federal government or knowingly making, using or causing to be made or used a false record or statement material to a false or fraudulent claim to the federal government. As a result of a modification made by the Fraud Enforcement and Recovery Act of 2009, a claim includes "any request or demand" for money or property presented to the U.S. government. Recently, several pharmaceutical and other healthcare companies have been prosecuted under these laws for, among other things, allegedly providing free product to customers with the expectation that the customers would bill federal programs for the product. Other companies have been prosecuted for causing false claims to be submitted because of the companies' marketing of the product for unapproved, and thus non-reimbursable, uses. The federal Health Insurance Portability and Accountability Act of 1996 ("HIPAA"), created new federal criminal statutes that prohibit knowingly and willfully executing, or attempting to execute, a scheme to defraud any healthcare benefit program, including private third-party payors and knowingly and willfully falsifying, concealing or covering up a material fact or making any materially false, fictitious or fraudulent statement in connection with the delivery of, or payment for, healthcare benefits, items or services.

In addition, we may be subject to data privacy and security regulation by both the federal government and the states in which we conduct our business. HIPAA, as amended by the Health Information Technology for Economic and Clinical Health Act ("HITECH"), and its implementing regulations, imposes certain requirements relating to the privacy, security and transmission of individually identifiable health information. Among other things, HITECH makes HIPAA's privacy and security standards directly applicable to business associates - independent contractors or agents of covered entities that receive or obtain protected health information in connection with providing a service on behalf of a covered entity. HITECH also created four new tiers of civil monetary penalties, amended HIPAA to make civil and criminal penalties directly applicable to business associates, and gave state attorneys general new authority to file civil actions for damages or injunctions in federal courts to enforce the federal HIPAA laws and seek attorney's fees and costs associated with pursuing federal civil actions. In addition, state laws govern the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways and may not have the same effect, thus complicating compliance efforts.

Additionally, the federal Physician Payments Sunshine Act within the PPACA, and its implementing regulations, require that certain manufacturers of drugs, devices, biologicals and medical supplies for which payment is available under Medicare, Medicaid or the Children's Health Insurance Program (with certain exceptions) to report information related to certain payments or other transfers of value made or distributed to physicians and teaching hospitals, or to entities or individuals at the request of, or designated on behalf of, the physicians and teaching hospitals and to report annually certain ownership and investment interests held by physicians and their immediate family members.

Also, many states have similar healthcare statutes or regulations that apply to items and services reimbursed under Medicaid and other state programs, or, in several states, apply regardless of the payor. Some states require the posting of information relating to clinical studies. In addition, California requires pharmaceutical companies to implement a comprehensive compliance program that includes a limit on expenditures for, or payments to, individual medical or health professionals. If our operations are found to be in violation of any of the health regulatory laws described above or any other laws that apply to us, we may be subject to penalties, including potentially significant criminal, civil and/or administrative penalties, damages, fines, disgorgement, individual imprisonment, exclusion of products from reimbursement under government programs, contractual damages, reputational harm, administrative burdens, diminished profits and future earnings and the curtailment or restructuring of our operations, any of which could adversely affect our ability to operate our business and our results of operations. To the extent that any of our products will be sold in a foreign country, we may be subject to similar foreign laws and regulations, which may include, for instance, applicable post-marketing requirements, including safety surveillance, anti-fraud and abuse laws and implementation of corporate compliance programs and reporting of payments or transfers of value to healthcare professionals.

Pharmaceutical Coverage, Pricing and Reimbursement

In both domestic and foreign markets, our sales of any approved products will depend in part on the availability of coverage and adequate reimbursement from third-party payors. Third-party payors include government health administrative authorities, managed care providers, private health insurers and other organizations. Patients who are prescribed treatments for their conditions and providers performing the prescribed services generally rely on third-party payors to reimburse all or part of the associated healthcare costs. Patients are unlikely to use our products unless coverage is provided and reimbursement is adequate to cover a significant portion of the cost of our products. Sales of our products will therefore depend substantially, both domestically and abroad, on the extent to which the costs of our products will be paid by third-party payors. These third-party payors are increasingly focused on containing healthcare costs by challenging the price and examining the cost-effectiveness of medical products and services. In addition, significant uncertainty exists as to the coverage and reimbursement status of newly approved healthcare product candidates. The market for our products and product candidates for which we may receive regulatory approval will depend significantly on access to third-party payors' drug formularies, or lists of medications for which third-party payors provide coverage and reimbursement. The industry competition to be included in such formularies often leads to downward pricing pressures on pharmaceutical companies. Also, third-party payors may refuse to include a particular branded drug in their formularies or otherwise restrict patient access to a branded drug when a less costly generic equivalent or other alternative is available.

Because each third-party payor individually approves coverage and reimbursement levels, obtaining coverage and adequate reimbursement is a time-consuming, costly and sometimes unpredictable process. We may be required to provide scientific and clinical support for the use of any product to each third-party payor separately with no assurance that approval would be obtained, and we may need to conduct expensive pharmacoeconomic studies in order to demonstrate the cost-effectiveness of our products. This process could delay the market acceptance of any product and could have a negative effect on our future revenues and operating results. We cannot be certain that our products and our product candidates will be considered cost-effective. Because coverage and reimbursement determinations are made on a payor-by-payor basis, obtaining acceptable coverage and reimbursement from one payor does not guarantee that we will obtain similar acceptable coverage or reimbursement from another payor. If we are unable to obtain coverage of, and adequate reimbursement and payment levels for, our product candidates from third-party payors, physicians may limit how much or under what circumstances they will prescribe or administer them and patients may decline to purchase them. This in turn could affect our ability to successfully commercialize our products and impact our profitability, results of operations, financial condition and future success.

In addition, in many foreign countries, particularly the countries of the European Union and China, the pricing of prescription drugs is subject to government control. In some non-U.S. jurisdictions, the proposed pricing for a drug must be approved before it may be lawfully marketed. The requirements governing drug pricing vary widely from country to country. For example, the European Union provides options for its member states to restrict the range of medicinal products for which their national health insurance systems provide reimbursement and to control the prices of medicinal products for human use. A member state may approve a specific price for the medicinal product or it may instead adopt a system of direct or indirect controls on the profitability of a company placing the medicinal product on the market. We may face competition for our product candidates from lower-priced products in foreign countries that have placed price controls on pharmaceutical products. In addition, there may be importation of foreign products that compete with our own products, which could negatively impact our profitability.

Healthcare Reform

In the U.S. and foreign jurisdictions, there have been, and we expect there will continue to be, a number of legislative and regulatory changes to the healthcare system that could affect our future results of operations as we begin to directly commercialize our products. In particular, there have been and continue to be a number of initiatives at the U.S. federal and state level that seek to reduce healthcare costs. If a drug product is reimbursed by Medicare or Medicaid, pricing and rebate programs must comply with, as applicable, the Medicaid rebate requirements of the Omnibus Budget Reconciliation Act of 1990, as amended, and the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA"). The MMA imposed new requirements for the distribution and pricing of prescription drugs for Medicare beneficiaries. Under Part D, Medicare beneficiaries may enroll in prescription drug plans offered by private entities that provide coverage of outpatient prescription drugs. Part D plans include both stand-alone prescription drug benefit plans and prescription drug coverage as a supplement to Medicare Advantage plans. Unlike Medicare Part A and B, Part D coverage is not standardized. Part D prescription drug plan sponsors are not required to pay for all covered Part D drugs, and each drug plan can develop its own drug formulary that identifies which drugs it will cover and at what tier or level. However, Part D prescription drug formularies must include drugs within each therapeutic category and class of covered Part D drugs, though not necessarily all the drugs in each category or class. Any formulary used by a Part D prescription drug plan must be developed and reviewed by a pharmacy and therapeutic committee. Government payment for some of the costs of prescription drugs may increase demand for our products for which we receive marketing approval. However, any negotiated prices for our future products covered by a Part D prescription drug plan will likely be lower than the prices we might otherwise obtain from non-governmental payors. Moreover, while the MMA applies only to drug benefits for Medicare beneficiaries, private payors often follow Medicare coverage policy and payment limitations in setting their own payment rates. Any reduction in payment that results from Medicare Part D may result in a similar reduction in payments from non-governmental payors.

Moreover, on November 27, 2013, the federal Drug Supply Chain Security Act was signed into law, which imposes new obligations on manufacturers of pharmaceutical products, among others, related to product tracking and tracing. Among the requirements of this new federal legislation, manufacturers will be required to provide certain information regarding the drug product to individuals and entities to which product ownership is transferred, label drug product with a product identifier, and keep certain records regarding the drug product. Further, under this new legislation, manufacturers will have drug product investigation, quarantine, disposition, and notification responsibilities related to counterfeit, diverted, stolen, and intentionally adulterated products, as well as products that are the subject of fraudulent transactions or which are otherwise unfit for distribution such that they would be reasonably likely to result in serious health consequences or death.

Furthermore, political, economic and regulatory influences are subjecting the healthcare industry in the U.S. to fundamental change. Initiatives to reduce the federal budget and debt and to reform healthcare coverage are increasing cost-containment efforts. We anticipate that Congress, state legislatures and the private sector will continue to review and assess alternative healthcare benefits, controls on healthcare spending through limitations on the growth of private health insurance premiums and Medicare and Medicaid spending, the creation of large insurance purchasing groups, price controls on pharmaceuticals and other fundamental changes to the healthcare delivery system. Any proposed or actual changes could limit or eliminate our spending on development projects and affect our ultimate profitability.

Under the Medicare Improvements for Patients and Providers Act ("MIPPA"), a basic case-mix adjusted composite, or bundled, payment system commenced in January 2011 and transitioned fully by January 2014 to a single reimbursement rate for drugs and all services furnished by renal dialysis centers for Medicare beneficiaries with end-stage renal disease. Specifically, under MIPPA the End-Stage Renal Disease Prospective Payment System (the "ESRD PPS") bundle now covers drugs, services, lab tests and supplies under a single treatment base rate for reimbursement by the CMS based on the average cost per treatment, including the cost of ESAs and IV iron doses, typically without adjustment for usage. It is unknown whether roxadustat, if approved in the U.S., will be included in the payment bundle or the timing of inclusion. Under MIPPA, agents that have no IV equivalent in the bundle are currently expected to be excluded from the bundle until 2025. If roxadustat were included in the bundle, it may reduce the price that could be charged for roxadustat, and therefore potentially limit our profitability. Based on roxadustat's differentiated mechanism of action and therapeutic effects, and discussions with our collaboration partner, we currently believe that roxadustat might not initially be included in the bundle and would instead be eligible for a Transitional Drug Add-on Payment Adjustment ("TDAPA") for a 24-month period. At the 24-month mark, CMS would determine if the TDAPA period should be extended for roxadustat or ended. When the TDAPA period ends, CMS will determine if roxadustat should be included in the bundle and, if so, what changes to the ESRD PPS reimbursement should be made. If roxadustat is included in the ESRD PPS bundle, it may have an impact on roxadustat pricing within Dialysis Organizations. If roxadustat is not included in the bundle after the TDAPA period, and would therefore be reimbursed outside of the bundle, it may potentially limit further market penetration of roxadustat.

In March 2010, PPACA was signed into law. PPACA has the potential to substantially change the way healthcare is financed by both governmental and private insurers. Among other cost containment measures, PPACA established: an annual, nondeductible fee on any entity that manufactures or imports certain branded prescription drugs and biologic agents; revised the methodology by which rebates owed by manufacturers to the state and federal government for covered outpatient drugs under the Medicaid Drug Rebate Program are calculated; increased the minimum Medicaid rebates owed by most manufacturers under the Medicaid Drug Rebate Program; and extended the Medicaid Drug Rebate program to utilization of prescriptions of individuals enrolled in Medicaid managed care organizations. There remain judicial and Congressional challenges to certain aspects of the PPACA. The U.S. Supreme Court is currently reviewing the constitutionality of the PPACA, but it is unknown when a decision will be reached. It is unclear how the U.S. Supreme Court ruling, other such litigation, and the healthcare reform measures of the Biden administration will impact the PPACA. In the future, there may continue to be additional proposals relating to the reform of the U.S. healthcare system, some of which could further limit the prices we are able to charge for our products, or the amounts of reimbursement available for our products. If future legislation were to impose direct governmental price controls and access restrictions, it could have a significant adverse impact on our business. Managed care organizations, as well as Medicaid and other government agencies, continue to seek price discounts.

Further, in the U.S. there has been heightened governmental scrutiny over the manner in which manufacturers set prices for their marketed products, which has resulted in several Congressional inquiries and proposed and enacted federal and state legislation designed to, among other things, bring more transparency to drug pricing, reduce the cost of prescription drugs under government payor programs, and review the relationship between pricing and manufacturer patient programs. At the federal level, the Trump administration used several means to propose or implement drug pricing reform, including through federal budget proposals, executive orders and policy initiatives. For example, on July 24, 2020 and September 13, 2020, the Trump administration announced several executive orders related to prescription drug pricing that attempt to implement several of the administration's proposals. The FDA also released a final rule, effective November 30, 2020, implementing a portion of the importation executive order providing guidance for states to build and submit importation plans for drugs from Canada. Further, on November 20, 2020, HHS finalized a regulation removing safe harbor protection for price reductions from pharmaceutical manufacturers to plan sponsors under Part D, either directly or through pharmacy benefit managers, unless the price reduction is required by law. The implementation of the rule has been delayed by the Biden administration from January 1, 2022 to January 1, 2023 in response to ongoing litigation. The rule also creates a new safe harbor for price reductions reflected at the point-of-sale, as well as a new safe harbor for certain fixed fee arrangements between pharmacy benefit managers and manufacturers, the implementation of which have also been delayed pending review by the Biden administration until March 22, 2021. On November 20, 2020, CMS issued an interim final rule implementing President Trump's Most Favored Nation executive order, which would tie Medicare Part B payments for certain physician-administered drugs to the lowest price paid in other economically advanced countries, effective January 1, 2021. On December 28, 2020, the United States District Court in Northern California issued a nationwide preliminary injunction against implementation of the interim final rule. However, it is unclear whether the Biden administration will work to reverse these measures or pursue similar policy initiatives.

Some states have implemented, and other states are considering, price controls or patient access constraints under the Medicaid program, and some states are considering price-control regimes that would apply to broader segments of their populations that are not Medicaid-eligible. Due to the volatility in the current economic and market dynamics, we are unable to predict the impact of any unforeseen or unknown legislative, regulatory, payor or policy actions, which may include cost containment and healthcare reform measures. Such policy actions could have a material adverse impact on our profitability.

Approval Process and Other Regulation in China

The pharmaceutical industry in China is highly regulated. The primary regulatory authority is the NMPA, including its provincial and local branches. As a developer, manufacturer and supplier of drugs, we are subject to regulation and oversight by the NMPA and its provincial and local branches. The Drug Administration Law of China provides the basic legal framework for the administration of the production and sale of pharmaceuticals in China and covers the manufacturing, distributing, packaging, pricing and advertising of pharmaceutical products. Its implementing regulations set forth detailed rules with respect to the administration of pharmaceuticals in China. In addition, we are, and we will be, subject to other Chinese laws and regulations that are applicable to business operators, manufacturers and distributors in general.

Pharmaceutical Clinical Development

A new drug must be approved by the NMPA before it can be manufactured and marketed for sale. To obtain NMPA approval, the applicant must conduct clinical trials, which must be approved by the NMPA and are subject to the NMPA's supervision and inspection. There are four phases of clinical trials. Application for registration of new drugs requires completion of Phase 1, 2 and 3 of clinical trials, similar to the U.S. In addition, the NMPA may require the conduct of Phase 4 studies as a condition to approval.

Phase 4 studies are post-marketing studies to assess the therapeutic effectiveness of and adverse reactions to the new drug, including an evaluation of the benefits and risks, when used among the general population or specific groups, with findings used to inform adjustments to dosage, among other things.

NDA and Approval to Market

China requires approval of the NDA as well as the manufacturing facility before a drug can be marketed in China. Approval and oversight are performed at national and provincial levels of the NMPA, involve multiple agencies and consist of various stages of approval.

Under the applicable drug registration regulations, drug registration applications are divided into three different types, namely Domestic NDA, Domestic Generic Drug Application, and Imported Drug Application. Drugs fall into one of three categories, namely chemical medicine, biological product or traditional Chinese or natural medicine.

Our roxadustat NDA for treatment of CKD anemia was submitted by FibroGen Beijing as a domestic entity under the Domestic Class 1 designation, which refers to a new drug that has never been marketed in any country.

Our NDA package in China contained information similar to what is necessary for a U.S. NDA, including preclinical data, clinical data, technical data on API and drug product, and related stability data. We are currently performing a safety study of 2,000 patients who will be treated for 52 weeks as part of our post-approval commitment to the NMPA.

Shortly before NDA approval, FibroGen Beijing conducted a three-batch validation campaign, one of which was observed onsite by the NMPA. Following the successful completion of the validation campaign and associated inspection, FibroGen Beijing was granted a cGMP certification for the commercial production of roxadustat at our Beijing manufacturing facility. We are using our FibroGen Beijing manufacturing facility for commercial supply of drug product. Our Cangzhou manufacturing facility has been fully qualified and licensed for manufacture of roxadustat API for the China market, and we will continue to use this facility for commercial supply. We may also qualify a third party manufacturer to produce commercial API under the Marketing Authorization Holder System program.

Pricing, Reimbursement, Hospital Listing, and Tendering

Please see the discussion above in the section "Roxadustat for the Treatment of Anemia in Chronic Kidney Disease in China."

Foreign Regulation Outside of China

In order to market any product outside of the U.S., we would need to comply with numerous and varying regulatory requirements of other countries and jurisdictions regarding quality, safety and efficacy and governing, among other things, clinical trials, manufacturing, marketing authorization, commercial sales and distribution of our products. Whether or not we obtain FDA approval for a product, we would need to obtain the necessary approvals by the comparable foreign regulatory authorities before we can commence clinical trials or marketing of the product in foreign countries and jurisdictions. Although many of the issues discussed above with respect to the U.S. apply similarly in the context of other countries we are seeking approval in, including Europe and China, the approval process varies between countries and jurisdictions and can involve different amounts of product testing and additional administrative review periods. For example, in Europe and in China, a sponsor must submit a clinical trial application ("CTA"), much like an IND prior to the commencement of human clinical trials. A CTA must be submitted to each national health authority and an independent ethics committee.

For other countries outside of the European Union, such as China and the countries in Eastern Europe, Latin America or Asia, the requirements governing the conduct of clinical trials, product licensing, pricing, and reimbursement vary from country to country. The time required to obtain approval in other countries and jurisdictions might differ from or be longer than that required to obtain FDA approval. Regulatory approval in one country or jurisdiction does not ensure regulatory approval in another, but a failure or delay in obtaining regulatory approval in one country or jurisdiction may negatively impact the regulatory approval process in other countries.

Regulatory Exclusivity for Approved Products

U.S. Patent Term Restoration

Depending upon the timing, duration, and specifics of the FDA approval of our product candidates, some of our U.S. patents may be eligible for limited patent term extension under the Drug Price Competition and Patent Term Restoration Act of 1984, commonly referred to as the Hatch-Waxman Act. The Hatch-Waxman Act permits a patent restoration term of up to five years as compensation for patent term lost during product development and the FDA regulatory review process. The patent term restoration period is generally one-half the time between the effective date of an initial IND and the submission date of an NDA or BLA, plus the time between the submission date of the NDA or BLA and the approval of that product candidate application. Patent term restoration cannot, however, extend the remaining term of a patent beyond a total of 14 years from the product's approval date. In addition, only one patent applicable to an approved product is eligible for the extension and the application for the extension must be submitted prior to the expiration of the patent. The U.S. Patent and Trademark Office, in consultation with the FDA, reviews and approves applications for any patent term extension or restoration. In the future, we expect to apply for restoration of patent term for patents relating to each of our product candidates in order to add patent life beyond the current expiration date of such patents, depending on the length of the clinical trials and other factors involved in the filing of the relevant NDA or BLA.

Market exclusivity provisions under the FDCA can also delay the submission or the approval of certain applications of companies seeking to reference another company's NDA or BLA. The Hatch-Waxman Act provides a 5-year period of exclusivity to any approved NDA for a product containing a NCE never previously approved by FDA either alone or in combination with another active moiety. No application or abbreviated NDA directed to the same NCE may be submitted during the 5-year exclusivity period, except that such applications may be submitted after four years if they contain a certification of patent invalidity or non-infringement of the patents listed with the FDA by the innovator NDA.

Biologic Price Competition and Innovation Act

The Biologics Price Competition and Innovation Act of 2009 ("BPCIA"), established an abbreviated pathway for the approval of biosimilar and interchangeable biological products. The abbreviated regulatory approval pathway establishes legal authority for the FDA to review and approve biosimilar biologics, including the possible designation of a biosimilar as "interchangeable" based on similarity to an existing branded product. Under the BPCIA, an application for a biosimilar product cannot be approved by the FDA until 12 years after the original branded product was approved under a BLA. However, an application may be submitted after four years if it contains a certification of patent invalidity or non-infringement to one of the patents listed with the FDA by the innovator BLA holder. The BPCIA is complex and is only beginning to be interpreted and implemented by the FDA. As a result, its ultimate impact, implementation, and interpretation are subject to uncertainty.

Orphan Drug Act

Pamrevlumab has received orphan drug designation in IPF, LAPC, and DMD in the U.S. Under the Orphan Drug Act, the FDA may grant orphan designation to a drug or biological product intended to treat a rare disease or condition, which is a disease or condition that affects fewer than 200,000 individuals in the U.S., or if it affects more than 200,000 individuals in the U.S. there is no reasonable expectation that the cost of developing and making a drug product available in the U.S. for this type of disease or condition will be recovered from sales of the product. Orphan product designation must be requested before submitting an NDA. After the FDA grants orphan product designation, the identity of the therapeutic agent and its potential orphan use are disclosed publicly by the FDA. Orphan product designation does not convey any advantage in or shorten the duration of the regulatory review and approval process.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 621 of 1730

If a product that has orphan designation subsequently receives the first FDA approval for the disease or condition for which it has such designation, the product is entitled to orphan product exclusivity, which means that the FDA may not approve any other applications to market the same drug or biological product for the same indication for seven years, except in limited circumstances, such as a showing of clinical superiority to the product with orphan exclusivity. The designation of such drug also entitles a party to financial incentives such as opportunities for grant funding towards clinical trial costs, tax advantages and user-fee waivers. Competitors, however, may receive approval of different products for the indication for which the orphan product has exclusivity or obtain approval for the same product but for a different indication for which the orphan product has exclusivity. Orphan product exclusivity also could block the approval of one of our products for seven years if a competitor obtains approval of the same drug or biological product as defined by the FDA or if our drug candidate is determined to be contained within the competitor's product for the same indication or disease. If a drug product designated as an orphan product receives marketing approval for an indication broader than what is designated, it may not be entitled to orphan product exclusivity in any indication.

The EMA has granted Orphan Medicinal Product Designation to pamrevlumab for the treatment of DMD. Orphan Medicinal Product Designation status in Europe has similar but not identical benefits in that jurisdiction.

Products receiving orphan designation in Europe can receive ten years of market exclusivity, during which time no similar medicinal product for the same indication may be placed on the market. The ten-year market exclusivity may be reduced to six years if, at the end of the fifth year, it is established that the product no longer meets the criteria for orphan designation; for example, if the product is sufficiently profitable not to justify maintenance of market exclusivity. Additionally, marketing authorization may be granted to a similar product for the same indication at any time if the second applicant can establish that its product, although similar, is safer, more effective or otherwise clinically superior; the initial applicant consents to a second orphan medicinal product application; or the initial applicant cannot supply enough orphan medicinal product. An orphan product can also obtain an additional two years of market exclusivity in Europe for pediatric studies. No extension to any supplementary protection certificate can be granted on the basis of pediatric studies for orphan indications.

Foreign Country Data Exclusivity

Europe also provides opportunities for additional market exclusivity. For example, in Europe, upon receiving marketing authorization, an NCE generally receives eight years of data exclusivity and an additional two years of market exclusivity. If granted, data exclusivity prevents regulatory authorities in Europe from referencing the innovator's data to assess a generic application. During the additional two-year period of market exclusivity, a generic marketing authorization can be submitted, and the innovator's data may be referenced, but no generic product can be marketed until the expiration of the market exclusivity.

In China, there is also an opportunity for data exclusivity for a period of six years for data included in an NDA applicable to a NCE. According to the Implementing Regulations of the PRC Drug Administration Law, the Chinese government protects undisclosed data from drug studies and prevents the approval of an application made by another company that uses the undisclosed data for the approved drug. In practice, the NMPA has not established an effective mechanism to enforce data exclusivity. The NMPA issued a draft regulation on regulatory data protection on April 25, 2018 for public comments but this draft regulation has yet to be finalized and implemented.

In addition, if an approved drug manufactured in China qualifies as an innovative drug or an improved new drug before December 1, 2019, such drugs will be eligible for a monitoring surveillance period for up to five years. During this post-marketing observation period, the NMPA will not accept marketing authorization applications filed by another company for the same product. Nor will the NMPA approve marketing authorization applications filed by another company to produce, change dosage form of or import the drug while the innovative or improved new drug is under observation for the purpose of protecting public health. The approved manufacturer is required to provide an annual report to the regulatory department of the province, autonomous region or municipality directly under the central government where it is located.

Each of the data exclusivity period and the observation period runs from the date of approval for production of the NCE or innovative or improved new drug, as the case may be.

INTELLECTUAL PROPERTY

Our success depends in part upon our ability to obtain and maintain patent and other intellectual property protection for our product candidates including compositions-of-matter, dosages, and formulations, manufacturing methods, and novel applications, uses and technological innovations related to our product candidates and core technologies. We also rely on trade secrets, know-how and continuing technological innovation to further develop and maintain our competitive position.

Our policy is to seek to protect our proprietary position by, among other methods, filing U.S. and foreign patent applications related to our proprietary technologies, inventions and any improvements that we consider important to the development and implementation of our business and strategy. Our ability to maintain and solidify our proprietary position for our products and technologies will depend, in part, on our success in obtaining and enforcing valid patent claims. Additionally, we may benefit from a variety of regulatory frameworks in the U.S., Europe, China, and other territories that provide periods of non-patent-based exclusivity for qualifying drug products. *Refer to "Government Regulation - Regulatory Exclusivity for Approved Products."*

We cannot ensure that patents will be granted with respect to any of our pending patent applications or with respect to any patent applications that may be filed by us in the future, nor can we ensure that any of our existing or subsequently granted patents will be useful in protecting our drug candidates, technological innovations, and processes. Additionally, any existing or subsequently granted patents may be challenged, invalidated, circumvented or infringed. We cannot guarantee that our intellectual property rights or proprietary position will be sufficient to permit us to take advantage of current market trends or otherwise to provide or protect competitive advantages. Furthermore, our competitors may be able to independently develop and commercialize similar products, or may be able to duplicate our technologies, business model, or strategy, without infringing our patents or otherwise using our intellectual property.

Our extensive worldwide patent portfolio includes multiple granted and pending patent applications relating to roxadustat and pamrevlumab. Currently granted patents relating to composition-of-matter for roxadustat and for pamrevlumab are expected, for each product candidate, to expire in 2024 or 2025, in each case exclusive of any patent term extension that may be available. U.S. and foreign patents relating to crystalline forms of roxadustat are expected to expire in 2033, exclusive of any extension. Additional patents and patent applications relating to manufacturing processes, formulations, and various therapeutic uses, including treatment of specific indications and improvement of clinical parameters, provide further protection for product candidates.

The protection afforded by any particular patent depends upon many factors, including the type of patent, scope of coverage encompassed by the granted claims, availability of extensions of patent term, availability of legal remedies in the particular territory in which the patent is granted, and validity and enforceability of the patent. Changes in either patent laws or in the interpretation of patent laws in the U.S. and other countries could diminish our ability to protect our inventions and to enforce our intellectual property rights. Accordingly, we cannot predict with certainty the enforceability of any granted patent claims or of any claims that may be granted from our patent applications.

The biotechnology and pharmaceutical industries are characterized by extensive litigation regarding patents and other intellectual property rights. Our ability to maintain and solidify our proprietary position for our products and core technologies will depend on our success in obtaining effective claims and enforcing those claims once granted. We have been in the past and are currently involved in various legal proceedings with respect to our patents and patent applications and may, as a result of our extensive portfolio, be involved in such proceedings in the future. Additionally, we may claim that a third party infringes our intellectual property or a third party may claim that we infringe its intellectual property. Such legal proceedings may be associated with significant expenses, damages, attorneys' fees, costs of proceedings and experts' fees, and management and employees may be required to spend significant time in connection with these actions.

Because of the extensive time required for clinical development and regulatory review of a product candidate we may develop, it is possible that any patent related to our product candidates may expire before any of our product candidates can be commercialized, or may remain in force for only a short period of time following commercialization, thereby reducing the advantage afforded by any such patent.

The patent positions for our most advanced programs are summarized below.

Roxadustat Patent Portfolio

Our roxadustat patent portfolio includes multiple granted U.S. patents offering protection for roxadustat, including protection for roxadustat composition-of-matter, for pharmaceutical compositions containing roxadustat, and for methods for treating anemia using roxadustat or its analogs. Exclusive of any patent term extension, the granted U.S. patents relating to the composition-of-matter of roxadustat are due to expire in 2024 or 2025, and granted foreign patents are due to expire in 2024. U.S. and foreign patents relating to crystalline forms of roxadustat are due to expire in 2033, and U.S. and foreign patents relating to photostable formulations of roxadustat are due to expire in 2034.

In 2020, oppositions were filed against our European Patent No. 2872488 (the "'488 Patent"), which claims a crystalline form of roxadustat, and our European Patent No. 3003284 (the "'284 Patent"), which claims photostable formulations of roxadustat. Final resolution of the opposition proceedings will take time and we cannot be assured that all or any claims will remain.

We believe that, if roxadustat is approved, a full five-year patent term extension under the Hatch-Waxman act will be available for a granted U.S. patent relating to roxadustat, which extension would expire in 2029 or 2030, depending on the patent extended. Refer to "Government Regulation - Regulatory Exclusivity for Approved Products - U.S. Patent Term Restoration."

We also hold various U.S. and foreign granted patents and pending patent applications directed to manufacturing processes, formulations, and methods for use of roxadustat.

Roxadustat China Patent Portfolio

Our roxadustat China patent portfolio includes granted patents covering roxadustat composition-of-matter, pharmaceutical compositions, methods of use, and manufacturing processes for roxadustat, as well as medicaments containing roxadustat for treating anemia and other conditions. Patents relating to roxadustat composition-of-matter and crystalline forms are due to expire in 2024 and 2033, respectively.

HIF Anemia-Related Technologies Patent Portfolio

We also have an extensive worldwide patent portfolio providing broad protection for proprietary technologies relating to the treatment of anemia and associated conditions. This portfolio currently contains granted patents and pending patent applications providing exclusivity for use of compounds falling within various and overlapping classes of HIF-PH inhibitors to achieve various therapeutic effects.

Various legal challenges have been initiated against this portfolio in several territories, including in Europe, the United Kingdom, Canada, and Japan. Regardless of the final outcome of any such actions, the potential narrowing or revocation of any of these patents does not affect our exclusivity for roxadustat or our freedom-to-operate with respect to use of roxadustat for the treatment of anemia in these or in other territories. A settlement has been reached in the litigation in Canada, resulting in the discontinuance of the action and leaving FibroGen's Canadian patents valid and enforceable.

In April 2020, in response to an invalidation action brought against certain of our United Kingdom patents by Akebia, the United Kingdom court handed down a decision invalidating United Kingdom designations of European Patent Nos. 1463823, 1633333, 2298301, 2322153, and 2322155. The United Kingdom designation to European Patent No. 2289531 was held to be valid in amended form, but not infringed by Akebia. We and our partner Astellas have filed an appeal of the decision in the United Kingdom Court of Appeal.

Pamrevlumab Patent Portfolio

Our pamrevlumab patent portfolio includes U.S. patents providing composition-of-matter protection for pamrevlumab and related antibodies, and for methods of using such in the treatment of fibroproliferative disorders, including IPF, liver fibrosis, and pancreatic cancer. Exclusive of any patent term extension, U.S. patents relating to pamrevlumab composition-of-matter are due to expire in 2024 or 2025. Corresponding foreign patents are due to expire, exclusive of any patent term extension, in 2024.

We believe that, if pamrevlumab is approved, a full five-year patent term extension under the Hatch-Waxman act will be available for a granted patent relating to pamrevlumab, which extension would expire in 2029 or 2030, depending on the patent extended.

We also hold additional granted U.S. and foreign patents and pending patent applications directed to the use of pamrevlumab to treat IPF, DMD, pancreatic cancer, liver fibrosis, and other disorders.

Trade Secrets and Know-How

In addition to patents, we rely upon proprietary trade secrets and know-how and continuing technological innovation to develop and maintain our competitive position. We seek to protect our proprietary information, in part, using confidentiality and other terms in agreements with our commercial partners, collaboration partners, consultants and employees. Such agreements are designed to protect our proprietary information, and may also grant us ownership of technologies that are developed through a relationship with a third party, such as through invention assignment provisions. Agreements may expire and we could lose the benefit of confidentiality, or our agreements may be breached and we may not have adequate remedies for any breach. In addition, our trade secrets may otherwise become known or be independently discovered by competitors.

To the extent that our commercial partners, collaboration partners, employees and consultants use intellectual property owned by others in their work for us, disputes may arise as to the rights in related or resulting know-how and inventions.

In-Licenses

Dana-Farber Cancer Institute

Effective March 2006, we entered into a license agreement with the Dana-Farber Cancer Institute ("DFCI"), under which we obtained an exclusive license to certain patent applications, patents and biological materials for all uses. The patent rights relate to inhibition of prolyl hydroxylation of the alpha subunit of hypoxia-inducible factor (HIFα), and include granted U.S. and foreign patents due to expire in 2022, exclusive of possible patent term extension. The licensed patents relate to use of HIF-PH inhibitors such as roxadustat.

Under the DFCI agreement, we are obligated to pay DFCI for past and ongoing patent prosecution expenses for the licensed patents. We are also obligated to pay DFCI annual maintenance fees, development milestone payments of up to \$425,000, sales milestone payments of up to \$3 million, and a sub-single-digit royalty on net sales by us or our affiliates or sublicensees of products that are covered by the licensed patents or incorporate the licensed biological materials. In addition, each sublicense we grant is subject to a one-time fixed amount payment to DFCI.

The agreement, along with any ongoing payment obligations, will continue in effect until the expiration of all licensed patents on a country-by-country basis, or, if there is no patent covering a licensed product incorporating the licensed biological materials, until 20 years after the effective date of the agreement. DFCI may terminate the agreement for our uncured material breach, if we cease to carry on our business and development activities with respect to all licensed products, if we fail to comply with our insurance obligations, or if we are convicted of a felony related to the manufacture, use, sale or importation of licensed products. We may terminate the agreement at any time on prior written notice to DFCI.

University of Miami

In May 1997, we entered into a license agreement with the University of Miami (the "University"), amended in July 1999, under which we obtained an exclusive, worldwide license to certain patent applications and patents for all uses. The current patent rights consist of a U.S. patent that relates to antibodies that specifically bind to biologically active fragments of CTGF, and is due to expire in 2022, exclusive of any patent term extension or adjustment that may be available. The licensed patent relates to pamrevlumab and related products.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 625 of 1730

Under the University agreement, we are obligated to pay for all ongoing patent expenses for the licensed patent. We were also obligated to pay an upfront licensing fee of \$21,500, all of which has been paid, and development milestone payments of up to \$450,000, of which \$150,000 has been paid, as well as an additional milestone payment, in the low hundreds of thousands of dollars, for each new indication for which we obtain approval for a licensed product, and a single digit royalty, subject to certain reductions, on net sales of licensed products by us or our affiliates or sublicensees.

The agreement, along with any ongoing payment obligations, will continue in effect until the expiration of all licensed patents, on a country-by-country basis. The University may terminate the agreement for our uncured material breach or bankruptcy. We may terminate the agreement for the University's uncured material breach or at any time on prior written notice to the University.

Bristol-Myers Squibb Company (Medarex, Inc.)

Effective July 9, 1998 and as amended on June 30, 2001 and January 28, 2002, we entered into a research and commercialization agreement with Medarex, Inc. and its wholly-owned subsidiary GenPharm International, Inc. (now, collectively, part of Bristol-Myers Squibb Company ("Medarex")) to develop fully human monoclonal antibodies for potential anti-fibrotic therapies. Under the agreement, Medarex was responsible for using its proprietary immunizable transgenic mice ("HuMAb-Mouse technology") during a specified research period (the "Research Period"), to produce fully human antibodies against our proprietary antigen targets, including CTGF, for our exclusive use.

The agreement granted us an option to obtain an exclusive worldwide, royalty-bearing, commercial license to develop antibodies derived from Medarex's HuMAb-Mouse technology, for use in the development and commercialization of diagnostic and therapeutic products. In December 2002, we exercised that option with respect to twelve antibodies inclusive of the antibody from which pamrevlumab is derived. We granted back to Medarex an exclusive, worldwide, royalty-free, perpetual, irrevocable license, with the right to sublicense, to certain inventions created during the parties' research collaboration, with such license limited to use by Medarex outside the scope of our licensed antibodies.

As a result of the exercise of our option to obtain the commercial license, Medarex is precluded from:

- (i) knowingly using any technology involving immunizable transgenic mice containing unrearranged human immunoglobulin genes with any of our antigen targets that were the subject of the agreement,
- (ii) granting to a third party a commercial license that covers such antigen targets or those antibodies derived by Medarex during the Research Period, and
- (iii) using any antibodies derived by Medarex during the Research Period, except as permitted under the agreement for our benefit or to prosecute patent applications in accordance with the agreement.

Medarex retained ownership of the patent rights relating to certain mice, mice materials, antibodies and hybridoma cell lines used by Medarex in connection with its activities under the agreement, and Medarex also owns certain claims in patents covering inventions that arise during the Research Period, which claims are directed to (i) compositions of matter (e.g., an antibody) except formulations of antibodies for therapeutic or diagnostic use, or (ii) methods of production. We own the patent rights to any inventions that arise during the Research Period that relate to antigens, as well as claims in patents covering inventions directed to (a) methods of use of an antibody, or (b) formulations of antibodies for therapeutic or diagnostic use. Upon exercise of our option to obtain the commercial license, we obtained the sole right but not obligation to control prosecution of patents relating solely to the licensed antibodies or products. Medarex has back-up patent prosecution rights in the event we decline to further prosecute or maintain such patents.

In addition to research support payments by us to Medarex during the Research Period, and an upfront commercial license fee in the form of 181,819 shares of FibroGen Series D Convertible Preferred Stock paid upon exercise of our option, we committed development-related milestone payments of up to \$11 million per therapeutic product containing a licensed antibody, and we have paid a \$1 million development-related milestone, in the form of 133,333 shares of FibroGen Series G Convertible Preferred Stock, and a cash payment of \$2 million, for pamrevlumab to date. At our election, the remaining milestone payments may be paid in common stock of FibroGen, Inc., or cash.

With respect to our sales and sales by our affiliates, the agreement also requires us to pay Medarex low single-digit royalties for licensed therapeutic products and low double-digit royalties plus certain capped sales-based bonus royalties for licensed diagnostic products. With respect to sales of licensed products by a sublicensee, we may elect to pay the foregoing royalties based on our sublicensee's sales, or a percentage (in the high-teens) of all payments received by us from such sublicensee. We are also required to reimburse Medarex any pass-through royalties, if any, payable under Medarex's upstream license agreements with Medical Research Council and DNX. Royalties payable by us under the agreement are on a licensed product-by-licensed product and country-by-country basis and subject to reductions in specified circumstances, and royalties are payable for a period until either expiration of patents covering the applicable licensed product or a specified number of years following the first commercial sale of such product in the applicable country.

Unless earlier terminated, the agreement will continue in effect for as long as there are royalty payment obligations by us or our sublicensees. Either party may terminate the agreement for certain material breaches by the other party, or for bankruptcy, insolvency or similar circumstances. In addition, we may also terminate the agreement for convenience upon written notice.

Third Party Filings

Numerous U.S. and foreign issued patents and pending patent applications, which are owned by third parties, exist in the fields in which we are developing products. Because patent applications can take many years to issue, there may be currently pending applications, unknown to us, which may later result in granted patents that use of our product candidates or proprietary technologies may infringe.

If a third party claims that we infringe its intellectual property rights, we may face a number of issues, including but not limited to, litigation expenses, substantial damages, attorney fees, injunction, royalty payments, cross-licensing of our patents, redesign of our products, or processes and related fees and costs.

We may be exposed to, or threatened with, future litigation by third parties having patent or other intellectual property rights alleging that our products, product candidates, and/or proprietary technologies infringe their intellectual property rights. If one of these patents were to be found to cover our products, product candidates, proprietary technologies, or their uses, we could be required to pay damages and could be restricted from commercializing our products, product candidates or using our proprietary technologies unless we obtain a license to the patent. A license may not be available to us on acceptable terms, if at all. In addition, during litigation, the patent holder might obtain a preliminary injunction or other equitable right, which could prohibit us from making, using or selling our products, technologies, or methods.

HUMAN RESOURCES

We had a total of 599 employees at FibroGen as of January 31, 2021. None of our U.S. employees are represented by a labor union. The employees of FibroGen Beijing are represented by a labor union under the China Labor Union Law. None of our employees have entered into a collective agreement with us.

We are highly committed to building a diverse, committed, and impassioned team to deliver innovative therapies to patients facing serious unmet medical needs. In 2020 we developed and approved a new Corporate Vision Statement and Values through the participation and input of many staff across the organization. One of these core values is "Respect for People" which includes a strong commitment to build a culture of inclusiveness and equality and foster a culture of individual growth and an environment of continued learning.

In 2020, we conducted a company-wide employee engagement survey. We had an overall participation rate by employees of 86% with over 90% of respondents reporting that they felt engaged around our core values of excellence, respect for people, integrity, and empowerment. Both of these scores significantly exceed normative industry participation and engagement benchmarks.

The biotechnology industry is an extremely competitive labor market and recruiting and retaining employees is critical to the continued success of our business. We focus on recruiting, retaining, and developing employees from a diverse range of backgrounds to conduct our research, development, commercialization, and administrative activities.

We consistently review and evaluate our compensation and employee benefits practices to ensure that we recruit and retain a highly trained and diverse workforce. This includes comprehensive medical and income protection, such as life insurance and retirement savings programs. In addition to coaching and internal growth and promotion opportunities, we provide employees access to over 5,000 developmental classes and programs through a learning management system.

In 2020 we deployed a state-of-art, human capital management system that will allow us to significantly expand our capabilities to develop and assess our employees. This system will also allow us to build comprehensive development and succession plans at all levels in the organization to ensure that we have a strong pipeline of highly trained employees. We also invested in health and safety measures for our employees who must work in the offices and labs during the COVID-19 pandemic.

We are committed to diversity, equity and inclusion. On our Board of Directors: five of our twelve members are women and/or from minority racial and ethnic groups. As of January 31, 2021, women represented 54% of our global workforce and 27% of our global leadership (VP and above). As of January 31, 2021, 57% of our U.S. workforce, and 16% of our U.S. leadership (VP and above), were from minority racial and ethnic groups.

In addition to furthering our investments in our human resources, we plan on continuing our efforts in 2021 in critical environmental, social, and governance areas.

FACILITIES

Our corporate and research and development operations are located in San Francisco, California, where we lease approximately 234,000 square feet of office and laboratory space with approximately 35,000 square feet subleased. The lease for our San Francisco headquarters expires in 2023. We also lease approximately 67,000 square feet of office and manufacturing space in Beijing, China, and multiple office spaces in Beijing and Shanghai, China. Our leases in China expire in 2023. We have constructed a commercial manufacturing facility of approximately 5,500 square meters in Cangzhou, China, on approximately 33,000 square meters of land. Our right to use such land expires in 2068. We believe our facilities are adequate for our current needs and that suitable additional or substitute space would be available if needed.

AVAILABLE INFORMATION

Our internet website address is www.fibrogen.com. In addition to the information about us and our subsidiaries contained in this Annual Report, information about us can be found on our website. The information contained on, or that can be accessed through, our website is not part of, and is not incorporated into, this Annual Report.

Our annual reports on Form 10-K, quarterly reports on Form 10-Q, current reports on Form 8-K and amendments to those reports filed or furnished pursuant to Section 13(a) or 15(d) of the Securities Exchange Act of 1934, as amended, are available free of charge through our website as soon as reasonably practicable after they are electronically filed with or furnished to the Securities and Exchange Commission ("SEC"). Additionally the SEC maintains an internet site that contains reports, proxy and information statements and other information. The address of the SEC's website is www.sec.gov.

CORPORATE INFORMATION

Our headquarters are located at 409 Illinois Street, San Francisco, California 94158 and our telephone number is (415) 978-1200. Our website address is www.FibroGen.com.

Our subsidiaries consist of the following: 1) FibroGen Europe Oy, a majority owned entity incorporated in Finland in 1996; 2) Skin Sciences, Inc., a majority owned entity incorporated in the State of Delaware in 1995; 3) FibroGen International (Cayman) Limited, a majority owned entity incorporated in the Cayman Islands in 2011; 4) FibroGen China Anemia Holdings Ltd., a majority owned entity incorporated in the Cayman Islands in 2012; 5) FibroGen International (Hong Kong) Limited, a majority owned entity incorporated in Hong Kong in 2011; 6) FibroGen (China) Medical Technology Development Co., Ltd., a majority owned entity incorporated in China in 2011; and 7) Beijing Falikang Pharmaceutical Co. Ltd., an unconsolidated variable interest entity incorporated in China in 2020.

"FibroGen," the FibroGen logo and other trademarks or service marks of FibroGen, Inc. appearing in this Annual Report are the property of FibroGen, Inc. This Annual Report contains additional trade names, trademarks and service marks of others, which are the property of their respective owners. We do not intend our use of display of other companies' trade names, trademarks or service marks to imply a relationship with, or endorsement or sponsorship of us by, these other companies.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 628 of 1730

ITEM 1A. RISK FACTORS

Investing in our common stock involves a high degree of risk. You should carefully consider the risks described below in addition to the other information included or incorporated by reference in this Annual Report on Form 10-K, including our consolidated financial statements and the related notes and "Management's Discussion and Analysis of Financial Condition and Results of Operations," before deciding whether to invest in our common stock. The occurrence of any of the events or developments described below could harm our business, financial condition, results of operations and growth prospects. In such an event, the market price of our common stock could decline, and you may lose all or part of your investment. Although we have discussed all known material risks, the risks described below are not the only ones that we may face. Additional risks and uncertainties not presently known to us or that we currently deem immaterial may also impair our business operations.

Risks Related to the Development and Commercialization of Our Product Candidates

We are substantially dependent on the success of our lead product, roxadustat, and our second compound in development, pamrevlumab.

To date, we have invested a substantial portion of our efforts and financial resources in the research and development of roxadustat and pamrevlumab. While we have received approval of our New Drug Applications ("NDA") for roxadustat in the People's Republic of China ("China"), Japan, and Chile for chronic kidney disease ("CKD") anemia for patients on dialysis and not on dialysis, we and our partners will need to make substantial additional investments in the development and commercialization of roxadustat worldwide and in various indications. Our near-term prospects, including maintaining our existing collaborations with Astellas Pharma Inc. ("Astellas") and AstraZeneca AB ("AstraZeneca"), will depend heavily on successful development and commercialization of roxadustat, including obtaining additional regulatory approvals for the commercialization of roxadustat for anemia associated with CKD.

Our other lead product candidate, pamrevlumab, is currently in clinical development for idiopathic pulmonary fibrosis ("IPF"), pancreatic cancer, and Duchenne muscular dystrophy ("DMD"). Pamrevlumab requires substantial further development and investment and we do not have a collaboration partner for support of this compound. In addition, pamrevlumab is a monoclonal antibody, which may require greater financial resources than for our small molecule, roxadustat.

As a company, we have limited commercialization experience, and the time and resources to develop such experience are significant. If we fail to achieve and sustain commercial success for roxadustat with our collaboration partners, our business would be harmed.

We do not have a sales or marketing infrastructure and have limited experience in the sales, marketing or distribution of pharmaceutical products in any country. To achieve commercial success for any product for which we obtain marketing approval, we will need to establish sales and marketing capabilities or make and maintain our existing arrangements with third parties to perform these services at a level sufficient to support our commercialization efforts.

To the extent that we would undertake sales and marketing of any of our products directly, there are risks involved with establishing our own sales, marketing and distribution capabilities. Factors that may inhibit our efforts to commercialize our products on our own include:

- our inability to recruit, train and retain adequate numbers of effective sales and marketing personnel;
- the inability of sales personnel to obtain access to physicians or persuade adequate numbers of physicians to prescribe any future products;
- our inability to effectively manage geographically dispersed commercial teams;
- the lack of complementary products to be offered by sales personnel, which may put us at a competitive disadvantage relative to companies with more extensive product lines; and
- unforeseen costs and expenses associated with creating an independent commercial organization.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 629 of 1730

With respect to roxadustat, we are dependent on the commercialization capabilities of our collaboration partners, AstraZeneca and Astellas. If either such partner were to terminate its agreement with us, we would have to commercialize on our own or with another third party. We will have limited control over the commercialization efforts of such third parties, and any of them may fail to devote the necessary resources and attention to sell and market our products, if any, effectively. If they are not successful in commercializing our product candidates, our business and financial condition would suffer.

Commercializing roxadustat requires us to establish commercialization systems, including but not limited to, medical affairs, pharmacovigilance, supply-chain, and distribution capabilities to perform our portion of the collaborative efforts. These efforts require resources and time. If we, along with Astellas and AstraZeneca, are not successful in our marketing, pricing and reimbursement strategies, facilitating adoption by dialysis organizations, health care professionals, recruiting sales and marketing personnel or in building a sales and marketing infrastructure, we will have difficulty commercializing roxadustat, which would adversely affect our business and financial condition.

Although regulatory approval has been obtained for roxadustat in China, Japan, and Chile, we may be unable to obtain regulatory approval in other countries, or such approval may be delayed or limited, due to a number of factors, many of which are beyond our control.

The clinical trials and the manufacturing of our product candidates are and will continue to be, and the marketing of our product candidates will be, subject to extensive and rigorous review and regulation by numerous government authorities in the United States ("U.S.") and in other countries where we intend to develop and, if approved, market any product candidates. Before obtaining regulatory approval for the commercial sale of any product candidate, we must demonstrate through extensive preclinical trials and clinical trials that the product candidate is safe and effective for use in each indication for which approval is sought. The regulatory review and approval process is expensive and requires substantial resources and time, and in general, very few product candidates that enter development ultimately receive regulatory approval. In addition, our collaboration partners for roxadustat have final control over development decisions in their respective territories and they may make decisions with respect to development or regulatory authorities that delay or limit the potential approval of roxadustat, or increase the cost of development or commercialization. Accordingly, we may be unable to successfully develop or commercialize roxadustat, pamrevlumab, or any of our other product candidates in one or more indications and jurisdictions.

Moreover, for any Phase 3 clinical trial to support an NDA/Biologics License Application submission for approval, the U.S. Food and Drug Administration ("FDA") and foreign regulatory authorities require compliance with regulations and standards (including good clinical practices ("GCP") requirements for designing, conducting, monitoring, recording, analyzing, and reporting the results of clinical trials) to ensure that (1) the data and results from trials are credible and accurate; and (2) that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we as the sponsor remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites. If we or any of our clinical research organizations ("CROs"), trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, the clinical data generated in our clinical trials may be deemed unreliable. Accordingly, the FDA or other regulatory authorities may require us to exclude the use of patient data from these unreliable clinical trials, or perform additional clinical trials before approving our marketing applications. The FDA or other regulatory authorities may even reject our application for approval or refuse to accept our future applications.

Regulatory authorities may take actions or impose requirements that delay, limit or deny approval of our product candidates for many reasons, including, among others:

- our failure to adequately demonstrate to the satisfaction of regulatory authorities that roxadustat is safe and effective in treating anemia in CKD or that pamrevlumab is safe and effective in treating IPF, pancreatic cancer, or DMD;
- our failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- our failure of clinical trials to meet the level of statistical significance required for approval;
- the determination by regulatory authorities that additional clinical trials are necessary to demonstrate the safety and efficacy of roxadustat or pamrevlumab, or that ongoing clinical trials need to be modified in design, size, conduct or implementation;
- our product candidates may exhibit an unacceptable safety signal as they advance through clinical trials, in particular controlled Phase 3 trials;

- the CROs that conduct clinical trials on our behalf may take actions outside of our control that materially adversely impact our clinical trials;
- we or third-party contractors manufacturing our product candidates may not maintain current good manufacturing practices ("cGMP"), successfully pass inspection or meet other applicable manufacturing regulatory requirements;
- regulatory authorities may not agree with our interpretation of the data from our preclinical trials and clinical trials; or
- · collaboration partners may not perform or complete their clinical programs in a timely manner, or at all.

Any of these factors, many of which are beyond our control, could jeopardize our or our collaboration partners' abilities to obtain regulatory approval for our product candidates in one or more indications.

The FDA or other regulatory authorities may require more information (including additional preclinical or clinical data to support approval), which may delay or prevent approval or cause us to abandon the development program altogether. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of Risk Evaluation and Mitigation Strategy ("REMS") (or other regulatory authorities may require the establishment of a similar strategy), that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us.

The results of the FDA Cardiovascular and Renal Drugs Advisory Committee meeting may affect roxadustat's approvability or label in CKD anemia.

On March 1, 2021, the FDA informed us that the Cardiovascular and Renal Drugs Advisory Committee will hold an advisory committee meeting to review the NDA for roxadustat. The date of the advisory committee meeting has not been set. As a result of this communication, we will not receive an approval decision by the PDUFA goal date of March 20, 2021. The advisory committee is a committee of external experts which will provide input on issues relating to benefit, risk, and interpretation of our roxadustat clinical trial data. We do not know when the FDA will convene the advisory committee or how long it will take after the committee convenes for the FDA to make a decision on our NDA. The results of the advisory committee may affect roxadustat's approvability or label. The FDA may further delay approval of our NDA if applicable regulatory criteria are not satisfied and/or the FDA requires additional testing or information. The full extent of the delay on an approval decision and impact of the advisory committee is unknown.

Preclinical, Phase 1 and Phase 2 clinical trial results may not be indicative of the results that may be obtained in larger clinical trials.

Clinical development is expensive and can take many years to complete, and its outcome is inherently uncertain. Failure can occur at any time during the clinical trial process. Success in preclinical and early clinical trials, which are often highly variable and use small sample sizes, may not be predictive of similar results in humans or in larger, controlled clinical trials, and successful results from clinical trials in one indication may not be replicated in other indications.

Many companies in the pharmaceutical and biotechnology industries have suffered significant setbacks in late-stage clinical trials after achieving positive results in early-stage development, and we may face similar setbacks.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 631 of 1730

We do not know whether our ongoing or planned clinical trials of roxadustat or pamrevlumab will need to be redesigned based on interim results or if we will be able to achieve sufficient patient enrollment or complete planned clinical trials on schedule.

Clinical trials can be delayed or terminated for a variety of reasons, including delay or failure to:

- address any physician or patient safety concerns that arise during the course of the trial;
- obtain required regulatory or institutional review board approval or guidance;
- reach timely agreement on acceptable terms with prospective CROs and clinical trial sites;
- recruit, enroll and retain patients through the completion of the trial, including for the duration of the Severe Acute Respiratory Syndrome Coronavirus 2 and the resulting Coronavirus Disease ("COVID-19") pandemic;
- maintain clinical sites in compliance with clinical trial protocols;
- initiate or add a sufficient number of clinical trial sites; and
- manufacture sufficient quantities of product candidate for use in clinical trials.

In particular, identifying and qualifying patients to participate in clinical trials of our product candidates is critical to our success. The timing of our clinical trials depends on the rate at which we can recruit and enroll patients in testing our product candidates. Patients may be unwilling to participate in clinical trials of our product candidates for a variety of reasons, some of which may be beyond our control, including:

- severity of the disease under investigation;
- availability of alternative treatments;
- size and nature of the patient population;
- eligibility criteria for and design of the study in question;
- perceived risks and benefits of the product candidate under study;
- ability to enroll patients in clinical trials during the COVID-19 pandemic (particularly for IPF);
- ongoing clinical trials of competitive agents;
- physicians' and patients' perceptions of the potential advantages of our product candidates being studied in relation to available therapies or other products under development:
- our CRO's and our trial sites' efforts to facilitate timely enrollment in clinical trials;
- patient referral practices of physicians; and
- ability to monitor patients and collect patient data adequately during and after treatment.

If we have difficulty enrolling a sufficient number of patients to conduct our clinical trials as planned, we may need to delay, limit or terminate ongoing or planned clinical trials.

In addition, we could encounter delays if a clinical trial is suspended or terminated by us, by the relevant institutional review boards at the sites at which such trials are being conducted, or by the FDA or other regulatory authorities. A suspension or termination of clinical trials may result from any number of factors, including failure to conduct the clinical trial in accordance with regulatory requirements or our clinical protocols, inspection of the clinical trial operations or trial site by the FDA or other regulatory authorities resulting in the imposition of a clinical hold, unforeseen safety issues or adverse side effects, changes in laws or regulations, or a principal investigator's determination that a serious adverse event could be related to our product candidates. Any delays in completing our clinical trials will increase the costs of the trial, delay the product candidate development and approval process and jeopardize our ability to commence marketing and generate revenues. Any of these occurrences may materially and adversely harm our business, operations, and prospects.

Our product candidates may cause or have attributed to them undesirable side effects or have other properties that delay or prevent their regulatory approval or limit their commercial potential.

Undesirable side effects caused by our product candidates or that may be identified as related to our product candidates by physician investigators conducting our clinical trials or even competing products in development that utilize a similar mechanism of action or act through a similar biological disease pathway could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. If we determine that there is a likely causal relationship between a serious adverse event and our product candidate, and such safety event is material or significant enough, it may result in:

- our clinical trial development plan becoming longer and more extensive;
- regulatory authorities increasing the data and information required to approve our product candidates and imposing other requirements; and
- our collaboration partners terminating our existing agreements.

The occurrence of any or all of these events may cause the development of our product candidates to be delayed or terminated, which could materially and adversely affect our business and prospects. Refer to "Business - Overview" in our Annual Report on Form 10-K for the year ended December 31, 2020 for a discussion of the adverse events and serious adverse events that have emerged in clinical trials of roxadustat and pamrevlumab.

Clinical trials of our product candidates may not uncover all possible adverse effects that patients may experience.

Clinical trials are conducted in representative samples of the potential patient population, which may have significant variability. Clinical trials are by design based on a limited number of subjects and of limited duration for exposure to the product used to determine whether, on a potentially statistically significant basis, the planned safety and efficacy of any product candidate can be achieved. As with the results of any statistical sampling, we cannot be sure that all side effects of our product candidates may be uncovered, and it may be the case that only with a significantly larger number of patients exposed to the product candidate for a longer duration, that a more complete safety profile is identified. Further, even larger clinical trials may not identify rare serious adverse effects or the duration of such studies may not be sufficient to identify when those events may occur. There have been other products, including erythropoiesis stimulating agents ("ESAs"), for which safety concerns have been uncovered following approval by regulatory authorities. Such safety concerns have led to labeling changes or withdrawal of ESAs products from the market. While our most advanced product candidate is chemically unique from ESAs, it or any of our product candidates may be subject to known or unknown risks. Patients treated with our products, if approved, may experience adverse reactions and it is possible that the FDA or other regulatory authorities may ask for additional safety data as a condition of, or in connection with, our efforts to obtain approval of our product candidates. If safety problems occur or are identified after our product candidates reach the market, we may, or regulatory authorities may require us to amend the labeling of our products, recall our products or even withdraw approval for our products.

If we or our manufactures cannot properly manufacture sufficient product, we may experience delays in development, regulatory approval, launch or successful commercialization.

Completion of our clinical trials and commercialization of our products require access to, or development of, facilities to manufacture and manage our product candidates at sufficient yields, quality and at commercial scale. Although we have entered into commercial supply agreements for roxadustat and pamrevlumab, we will need to enter into additional commercial supply agreements, including for backup or second source third-party manufacturers. We may not be able to enter into these agreements with satisfactory terms or on a timely manner. In addition, we may experience delays or technical problems associated with technology transfer of manufacturing processes to any new suppliers.

We have limited experience manufacturing or managing third parties in manufacturing any of our product candidates in the volumes that are expected to be necessary to support large-scale clinical trials and sales. In addition, we have limited experience forecasting supply requirements or coordinating supply chain (including export management) for launch or commercialization, which is a complex process involving our third-party manufacturers and logistics providers, and for roxadustat, our collaboration partners. We may not be able to accurately forecast supplies for commercial launch, or do so in a timely manner and our efforts to establish these manufacturing and supply chain management capabilities may not meet our requirements as to quantities, scale-up, yield, cost, potency or quality in compliance with cGMP, particularly if the marketing authorization or market uptake is more rapid than anticipated or we have an unanticipated surge in demand.

We have a limited amount of roxadustat and pamrevlumab in storage, limited capacity reserved at our third-party manufactures, and, even if we have or are able to put supply agreements in place for our products, there are long lead times required to manufacture and scale-up the manufacture of additional supply, as required for both late-stage clinical trials, post-approval trials, and commercial supply. If we are unable to forecast, order or manufacture sufficient quantities of roxadustat or pamrevlumab on a timely basis, it may delay our development, launch or commercialization in some or all indications we are currently pursuing. Any delay or interruption in the supply of our product candidates or products could have a material adverse effect on our business and operations.

Our commercial drug product and the product we use for clinical trials must be produced under applicable cGMP regulations. Failure to comply with these regulations may require us to recall commercial product or repeat clinical trials, which would impact sales revenue or delay the regulatory approval process.

We may add or change manufacturers for our products. We may also make changes to our manufacturing processes or to our product specifications, including in order to accommodate changes in regulations, manufacturing equipment or to account for different processes at new or second source suppliers. If we make any such changes with respect to roxadustat or pamrevlumab we will need to demonstrate comparability to the products and processes already approved or in approval by various regulatory authorities, including potentially through the conduct of additional clinical trials. Even if we do demonstrate comparability, a regulatory agency could challenge that result which could delay our development or commercialization progress. Any of these occurrences may materially impact our operations and potential profitability.

We, and even an experienced third-party manufacturer, may encounter difficulties in production. Difficulties may include:

- costs and challenges associated with scale-up and attaining sufficient manufacturing yields, in particular for biologic products such as pamrevlumab, which is a monoclonal antibody;
- contracting with additional suppliers and validation/qualification of additional facilities to meet growing demand;
- supply chain issues, including coordination of multiple contractors in our supply chain and securing necessary licenses (such as export licenses);
- the timely availability and shelf life requirements of raw materials and supplies;
- limited stability and product shelf life;
- equipment maintenance issues or failure;
- quality control and quality assurance issues;
- shortages of qualified personnel and capital required to manufacture large quantities of product;
- · compliance with regulatory requirements that vary in each country where a product might be sold;
- · capacity or forecasting limitations and scheduling availability in contracted facilities; and
- natural disasters, such as pandemics, including the COVID-19 pandemic, floods, storms, earthquakes, tsunamis, and droughts, or accidents such as fire, that affect facilities, possibly limit or postpone production, and increase costs.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 634 of 1730

Regulatory authorities will do their own benefit risk analysis and may reach a different conclusion than we or our partners have, and these regulatory authorities may base their approval decision on different analyses, data, and statistical methods than ours.

Even if we believe we have achieved positive clinical results, such as superiority or non-inferiority, in certain endpoints, populations or subpopulations, or using certain statistical methods of analysis, the FDA and European Medicines Agency ("EMA") will each conduct their own benefit-risk analysis and may reach different conclusions, using different statistical methods, different endpoints or definitions thereof, or different patient populations or sub-populations, and regulatory authorities may change their approvability criteria based on their internal analyses and discussions with expert advisors. Regulatory authorities may approve roxadustat for fewer or more limited indications than we request or may grant approval contingent on the performance of costly post-approval clinical trials. While we will present to regulatory authorities certain pre-specified and not pre-specified sub-populations and sub-group analyses (for example, incident dialysis), multiple secondary endpoints, and multiple analytical methods (such as long-term follow up analyses), including adjusted and censored data, regulatory authorities may reject these analyses, methods, or even parts of our trial design or certain data from our studies, the rationale for our pre-specified non-inferiority margins or other portions of our statistical analysis plans. In addition, even if we are able to provide positive data with respect to certain analyses, such as incident dialysis, estimated glomerular filtration rate, hepcidin, or quality of life measures, regulatory authorities may not include such claims on any approved labeling for roxadustat, which may limit the commercialization or market opportunity for roxadustat. The failure to obtain regulatory approval, or any label, population or other approval limitations in any jurisdiction, may significantly limit our ability to generate revenues, and any failure to obtain such approval for all of the indications and labeling claims we deem desirable could reduce our potential revenue.

Even if we are able to obtain regulatory approval of our product candidates, the label we obtain may limit the indicated uses for which our product candidates may be marketed.

With respect to roxadustat, regulatory approvals obtained, could limit the approved indicated uses for which roxadustat may be marketed. For example, our label approved in Japan, includes the following warning: "Serious thromboembolism such as cerebral infarction, myocardial infarction, and pulmonary embolism may occur, possibly resulting in death, during treatment with roxadustat." Additionally, in the U.S., ESAs have been subject to significant safety warnings, including the boxed warnings on their labels. The safety concerns relating to ESAs may result in labeling for roxadustat containing similar warnings even if our Phase 3 clinical trials do not suggest that roxadustat has similar safety issues. Even if the label for roxadustat does not contain all of the warnings contained in the boxed warning for ESAs, the label for roxadustat may contain other warnings or limit the market opportunity or approved indications for roxadustat. These warnings could include warnings against exceeding specified hemoglobin targets and other warnings that derive from the lack of clarity regarding the safety issues associated with ESAs, even if our Phase 3 clinical trials do not themselves raise safety concerns.

We face substantial competition in the discovery, development and commercialization of product candidates.

The development and commercialization of new pharmaceutical products is highly competitive. Our future success depends on our ability and/or the ability of our collaboration partners to achieve and maintain a competitive advantage with respect to the development and commercialization of our product candidates. Our objective is to discover, develop and commercialize new products with superior efficacy, convenience, tolerability, and safety. We expect that in many cases, the products that we commercialize will compete with existing, market-leading products of companies that have large, established commercial organizations.

If roxadustat is approved and launched commercially, competing drugs are expected to include ESAs, particularly in those patient segments where ESAs are used. Currently available ESAs include epoetin alfa (EPOGEN®, marketed by Amgen Inc. in the U.S., Procrit® and Erypo®/Eprex®, marketed by Johnson & Johnson Inc., and Espo® marketed by Kyowa Hakko Kirin in Japan and China), darbepoetin (Amgen/Kyowa Hakko Kirin's Aranesp® and NESP®) and Mircera® marketed by Hoffmann-La Roche ("Roche") outside of the U.S. and by Vifor Pharma, a Roche licensee, in the U.S. and Puerto Rico, as well as biosimilar versions of these currently marketed ESA products. ESAs have been used in the treatment of anemia in CKD for more than 30 years, serving a significant majority of dialysis CKD patients. While non-dialysis CKD patients who are not under the care of nephrologists, including those with diabetes and hypertension, do not typically receive ESAs and are often left untreated, some non-dialysis patients under nephrology or hematology care may be receiving ESA therapy. It may be difficult to encourage healthcare providers and patients to switch to roxadustat from products with which they have become familiar.

We may also face competition from potential new anemia therapies currently in clinical development, including in those patient segments not adequately addressed by ESAs. Companies that are currently developing hypoxia-inducible factor ("HIF") prolyl hydroxylase (together with HIF, "HIF-PH") inhibitors for anemia in CKD indications include GlaxoSmithKline plc ("GSK"), Bayer Corporation ("Bayer"), Akebia Therapeutics, Inc. ("Akebia"), Otsuka Pharmaceutical ("Otsuka"), Akebia's partner in the U.S. and Europe, Japan Tobacco, and Zydus Cadila (India) ("Zydus"). Akebia has completed Phase 3 studies in CKD patients on dialysis and not on dialysis in the U.S., as well as a Phase 3b, randomized, open-label, active-controlled trial evaluating the efficacy and safety of oral vadadustat once daily and three times weekly for the maintenance treatment of anemia in hemodialysis subjects converting from erythropoiesis stimulating agents. The study completion date is estimated to be May 2022. Akebia announced an additional Phase 3 study evaluating the efficacy and safety of dose conversion from a long-acting erythropoiesis stimulating agent (Mircera®) to three times weekly oral vadadustat for the maintenance treatment of anemia in hemodialysis subjects. The estimated study start date is February 2021. Akebia has publicly stated their intent to file the vadadustat NDA in the U.S. in the second quarter of 2021.

In Japan, Mitsubishi Tanabe Pharmaceutical Corporation, Akebia's collaboration partner, received approval for vadadustat on June 29, 2020 for the treatment of anemia of CKD patients on and not on dialysis. GSK received approval for daprodustat in Japan on June 29, 2020 for the treatment of anemia of CKD patients on and not on dialysis. Price listing for the launch in Japan of both vadadustat and daprodustat occurred in the third quarter of 2020, with pricing in line with roxadustat pricing. GSK is also conducting global Phase 3 studies in CKD patients on dialysis and not on dialysis, and expects to complete those studies by March 2022. GSK and Kyowa Hakko Kirin announced in November 2018 that the two companies signed a strategic commercialization deal in Japan for daprodustat. Bayer has completed global Phase 2 studies and its HIF-PH inhibitor is now in Phase 3 development in CKD populations on dialysis and not on dialysis in Japan. Japan Tobacco received approval in Japan for enarodustat for the treatment of anemia in CKD patients on dialysis and not on dialysis, to be sold by Torii Pharmaceuticals Ltd as ENAROY®. Japan Tobacco and its partner JW Pharmaceuticals started a Phase 3 study in dialysis patients in Korea in 2019. Zydus started Phase 3 studies in dialysis and non-dialysis CKD patients in India in 2019.

In July 2020, Zydus received approval from the FDA to begin a Phase 1 study of desidustat for the treatment of chemotherapy-induced anemia, which could potentially be competitive with roxadustat within this indication.

Reblozyl® (luspatercept) was approved by the FDA in April 2020 for the treatment of anemia in adults with myelodysplastic syndromes with ring sideroblasts or myelodysplastic/myeloproliferative neoplasms with ring sideroblasts and thrombocytosis who need regular red blood cell transfusions and have not responded well to or cannot receive an ESA. It is the first and only erythroid maturation agent approved in the U.S., Europe, and Canada and is part of a global collaboration between Acceleron Pharma, Inc. and Bristol Myers Squibb. In 2020, Reblozyl net revenue was \$274 million, including \$115 million in Q4 2020.

In addition, we will likely face competition from other companies developing biologic therapies for the treatment of other anemia indications that we may also seek to pursue in the future. We may face competition for patient recruitment, enrollment for clinical trials, and potentially in commercial sales. There may also be new therapies for renal-related diseases that could limit the market or level of reimbursement available for roxadustat.

In China, ESA is considered the standard of care for treatment of anemia of CKD, and locally manufactured epoetin alfa is offered by 15 local manufacturers including the market leader EPIAO that is marketed by 3SBio Inc. We may face potential competition from other HIF-PH inhibitors. Companies active in the US such as Akebia, Bayer, and GSK have been authorized by the National Medical Products Administration ("NMPA") to conduct trials in China to support its ex-China regulatory filings. A number of domestic companies, including Jiangsu Hengrui Medicine Co., Ltd., Guandong Sunshine Health Investment Co., Ltd., 3SBio Inc., and Hangzhou Andao Pharmaceutical Co. have been permitted by the NMPA to conduct clinical trials in their locally-developed HIF-PH inhibitor investigational compounds for the treatment of anemia in CKD. Domestic companies are also in-licensing global compounds to be developed as domestic drugs, including China Medical System which in-licensed desidustat, a compound that is currently in Phase 3 trials in India, from Zydus for greater China in January 2020. In January 2021, China Medical System Holdings Ltd. was granted approval by the Chinese NMPA to begin trials for desidustat in patients with anemia of CKD, including dialysis and non-dialysis patients. Shenzhen Salubris Pharmaceutical Co., Ltd., a domestic company in China, has in-licensed enarodustat from Japan Tobacco and received NMPA approval in the third quarter of 2020 to initiate Phase 3 studies. We will also face competition from generics who could enter the market after expiry of our patents in China, and two potential market players have already started bioequivalence studies, including Chia Tai-Tiangqing Pharmaceutical Holdings and CSPA Pharmaceutical Group.

The first biosimilar ESA, Pfizer's Retacrit® (epoetin zeta), entered the U.S. market in November 2018. Market penetration of Retacrit and the potential addition of other biosimilar ESAs currently under development may alter the competitive and pricing landscape of anemia therapy in CKD patients on dialysis under the end-stage renal disease bundle. The patents for Amgen's EPOGEN® (epoetin alfa) expired in 2004 in Europe, and the final material patents in the U.S. expired in May 2015. Several biosimilar versions of currently marketed ESAs are available for sale in Europe, China and other territories. In the U.S., a few ESA biosimilars are currently under development. Sandoz, a division of Novartis, markets Binocrit® (epoetin alfa) in Europe and may file a biosimilar Biologics License Application in the U.S.

The majority of the current CKD anemia market focuses on dialysis patients, who visit dialysis centers on a regular basis, typically three times a week, and anemia therapies are administered as part of the visit. Two of the largest operators of dialysis clinics in the U.S., DaVita Healthcare Partners Inc. ("DaVita"), and Fresenius Medical Care AG & Co. KGaA ("Fresenius"), collectively provide dialysis care to more than 80% of U.S. dialysis patients, and therefore have historically executed long-term contracts including rebate terms with Amgen. Successful penetration in this market will likely require our partner AstraZeneca to enter into a definitive agreement with Fresenius, DaVita, or other dialysis organizations, on favorable pricing terms and on a timely basis.

If approved and launched commercially to treat IPF, pamrevlumab is expected to compete with Roche's Esbriet® (pirfenidone), and Boehringer Ingelheim's Ofev® (nintedanib). We believe that if pamrevlumab can be shown to safely stabilize or reverse lung fibrosis, and thus stabilize or improve lung function in IPF patients, it can compete with pirfenidone and nintedanib for market share in IPF. However, it may be difficult to encourage treatment providers and patients to switch to pamrevlumab from an oral product with which they are already familiar to a product delivered via in-office infusion. Furthermore, pirfenidone and nintedanib may be produced as generics in the near future. We may also face competition from potential new IPF therapies in recruitment and enrollment in our clinical trials and potentially in commercialization.

Pamrevlumab is a monoclonal antibody that may be more expensive and less convenient than oral small molecules such as nintedanib and pirfenidone. Other potential competitive product candidates in various stages of development for IPF include Kadmon Holdings, Inc.'s KD025, Liminal BioSciences' PBI-4050, and Roche/Promedior, Inc.'s PRM-151.

If pamrevlumab is approved and launched commercially to treat locally advanced pancreatic cancer patients who are not candidates for surgical resection, pamrevlumab may face competition from products currently used for pancreatic cancer. These include FOLFRINOX, a combination chemotherapy regimen of folic acid, 5-fluouracil, oxaliplatin and irinotecan, and agents seeking approval in combination with gemcitibine and nab-paclitaxel from companies such as Rafael Pharma's defactinib/CPI-613 and Merrimack's istiratumab. Gemcitabine and/or nab-paclitaxel are the current standard of care in the first-line treatment of metastatic pancreatic cancer.

Celgene Corporation's Abraxane® (nab-paclitaxel) was launched in the U.S. and Europe in 2013 and 2014, and was the first drug approved in this disease in nearly a decade.

If approved and launched commercially to treat DMD, pamrevlumab is expected to face competition from drugs that have been approved in major markets such as the U.S., European Union, and Japan. On September 19, 2016, the FDA approved Sarepta Therapeutics Inc.'s ("Sarepta") Exondys 51TM (eteplirsen). Exondys 51 is approved to treat patients who have a mutation of the dystrophin gene amenable to exon 51 skipping, representing approximately 13% of patients with DMD. In Europe, Sarepta received a negative opinion for its marketing application for eteplirsen from the EMA in September 2018. Sarepta has reported a full year Exondys 51 revenue of \$380 million in 2019. Sarepta's Vyondys 53TM (golodirsen) was approved by the FDA in December 2019 for patients with a confirmed genetic mutation that is amenable to exon 53 skipping, which accounts for approximately 8% of the DMD population. Sarepta's Amondys 45TM (casimersen) was approved by the FDA in February 2021 for patients with a confirmed genetic mutation that is amenable to exon 45 skipping, which accounts for approximately 8% of the DMD population.

PTC Therapeutics' product Translarna TM received a conditional approval in Europe in 2014, which was renewed in November 2016 with a request for a new randomized placebo-controlled 18-month study by the Committee for Medicinal Products for Human Use of the EMA; however, the FDA informed the sponsor in a complete response letter in October 2017, as well as in its response to PTC Therapeutics' appeal, that the FDA is unable to approve the application in its current form. An additional Phase 3 study is currently ongoing. While Translarna TM targets a different set of DMD patients from those targeted by Sarepta's Exondys 51®, it is also limited to a subset of patients who carry a specific mutation. Conversely, pamrevlumab is intended to treat DMD patients without limitation to type of mutation.

Pamrevlumab may also face competition from other drugs currently in clinical development in patient recruiting and enrollment in clinical trials, and, if approved, in commercialization. Examples of those compounds currently under clinical development are the drug candidates from Pfizer, Pliant, Galecto, and Sarepta. Pfizer initiated a Phase 3 study with PF-06939926, its AAV9 mini-dystrophin gene therapy for DMD in February 2020. Pliant's PLN-74809 and Galecto's lead candidate GB0139, are in Phase 2 development for IPF.

The success of any or all of these potential competitive products may negatively impact the development and potential for success of pamrevlumab. In addition, any competitive products that are on the market or in development may compete with pamrevlumab for patient recruitment and enrollment for clinical trials or may force us to change our clinical trial design, including, in order to compare pamrevlumab against another drug, which may be the new standard of care.

Moreover, many of our competitors have significantly greater resources than we do. Large pharmaceutical companies, in particular, have extensive experience in clinical testing, obtaining regulatory approvals, recruiting patients, manufacturing pharmaceutical products, and commercialization. In the potential anemia market for roxadustat, for example, large and established companies such as Amgen and Roche, among others, compete aggressively to maintain their market shares. In particular, the currently marketed ESA products are supported by large pharmaceutical companies that have greater experience and expertise in commercialization in the anemia market, including in securing reimbursement, government contracts and relationships with key opinion leaders; conducting testing and clinical trials; obtaining and maintaining regulatory approvals and distribution relationships to market products; and marketing approved products. These companies also have significantly greater scale, research and marketing capabilities than we do and may also have products that have been approved or are in later stages of development and have collaboration agreements in our target markets with leading dialysis companies and research institutions. If we and our collaboration partners are not able to compete effectively against existing and potential competitors, our business and financial condition may be materially and adversely affected.

No or limited reimbursement or insurance coverage of our approved products, if any, by third-party payors may render our products less attractive to patients and healthcare providers.

Market acceptance and sales of any approved products will depend significantly on reimbursement or coverage of our products by government or third-party payors and may be affected by existing and future healthcare reform measures or prices of related products for which the government or third-party reimbursement applies. Coverage and reimbursement by the government or a third-party payor may depend upon a number of factors, including the payor's determination that use of a product is:

- a covered benefit under applicable health plan;
- safe, effective and medically necessary;
- appropriate for the specific patient;
- · cost-effective; and
- · neither experimental nor investigational.

Obtaining coverage and reimbursement approval for a product from a government or other third-party payor is a time consuming and costly process that could require us to provide supporting scientific, clinical and cost-effectiveness data for the use of our products to the payor, which we may not be able to provide. Furthermore, the reimbursement policies of governments and third-party payors may significantly change in a manner that renders our clinical data insufficient for adequate reimbursement or otherwise limits the successful marketing of our products. Even if we obtain coverage for our product candidates, the pricing may be subject to re-negotiations or third-party payors may not establish adequate reimbursement amounts, which may reduce the demand for, or the price of, our products. For example, our current National Reimbursement Drug List reimbursement pricing for China is effective for a standard two-year period (between January 1, 2020 to December 31, 2021), after which time we will have to renegotiate a new price for roxadustat, which we expect to be lower based upon historical precedents.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 638 of 1730

Reference pricing is used by various Europe member states and parallel distribution, or arbitrage between low-priced and high-priced member states, can further reduce prices. In some countries, our partner or we may be required to conduct a clinical trial or other studies that compare the cost-effectiveness of our product candidates to other available products in order to obtain or maintain reimbursement or pricing approval. Publication of discounts by third-party payors or authorities may lead to further pressure on the prices or reimbursement levels within the country of publication and other countries. If reimbursement of our products is unavailable or limited in scope or amount, or if pricing is set at unacceptable levels, we or our partner may elect not to commercialize our products in such countries, and our business and financial condition could be adversely affected.

Risks Related to Severe Acute Respiratory Syndrome Coronavirus 2 and the Resulting Coronavirus Disease ("COVID-19")

Our business could continue to be adversely affected by the ongoing COVID-19 global pandemic.

The effects of the COVID-19 pandemic, the associated government-mandated restrictions and the other effects on healthcare systems, the economy, and society as a whole, may negatively impact productivity, disrupt our business, and delay our clinical programs and timelines, the magnitude of which will depend, in part, on the progression of the disease, the length and severity of the restrictions, and other impacts and limitations on our ability to conduct our business in the ordinary course. These disruptions in our operations could negatively impact our business, operating results, and financial condition. While certain COVID-19 vaccines have received regulatory approval, it is uncertain if and when sufficient vaccines will have been distributed to lessen the economic and other effects of COVID-19, and the efficacy of such vaccines in preventing the spread and effects of COVID-19 and other variants is unclear.

The extent of the impact on the COVID-19 pandemic on our business and financial results will continue to depend on numerous evolving factors that we are not able to accurately predict and which will vary by market, including the duration and scope of the pandemic, global economic conditions during and after the pandemic, the speed and efficacy of vaccinations around the world, and governmental actions that have been taken, or may be taken in the future, in response to the pandemic.

We have taken measures to minimize the health risks of COVID-19 to our staff, patients, healthcare providers, and their communities, as their safety and well-being are our top priority. Despite these efforts, there is a risk that one or more of our employees, including members of senior management, could contract COVID-19. Our U.S. employees are working remotely when possible, and we may experience reduced productivity due to the remote work environment. In addition, there are other risks from remote work including but not limited to the potential for reduced oversight of third parties we work with, such as manufacturing and clinical sites.

China was able to minimize the impact of COVID-19 on the economy in 2020 relative to other major economies. However, if there are any further COVID-19 outbreaks, we or our partners may need to re-institute or tighten restrictions on our operations.

We have seen impacts from COVID-19 on all of our clinical trials to varying degrees. There is a risk that any or all of our clinical trials will be further delayed, in particular our studies in IPF, due to a continued or further outbreak which can slow or pause enrollment or site initiation and other direct COVID-19 impacts to clinical sites and clinical service providers. In addition, while we are trying to mitigate the effect of COVID-19 on existing patients, it is possible that some patients may not be able to continue to comply with protocols, which could further delay our clinical trial progress.

We believe we have sufficient roxadustat and pamrevlumab supplies for our expected commercial and clinical requirements over the next year and we and our manufacturing partners are currently continuing manufacturing operations. However, we only have a limited stockpile of these drug supply products, and therefore, if there is a greater impact from the COVID-19 pandemic than we have expected, or if manufacturing operations are halted again, or if drug product expires due to slowed clinical trials, we could face shortages in our global supply chains. COVID-19 has created increased demand for the limited global biologics manufacturing capacity, and as a result, we have faced competition for manufacturing supplies due to prioritization of COVID-19 related manufacturing. We could face additional competition for such manufacturing supplies, including reagents, supplements and media, and may face competition to use available capacity at our manufacturing partners. Any such supply disruptions could adversely impact our clinical development and ability to generate revenues from our approved products and our business, financial condition, results of operations and growth prospects could be materially adversely affected. There may be unexpected regulatory delays due to the COVID-19 pandemic including due to travel restrictions impacting pre-approval inspections.

Due to these and potentially additional business disruptions, there may be delays to any of our business areas including our drug supply chains, problems with our distribution or warehousing vendors, or delays to our (and our partners') clinical trials or other development efforts, or commercialization and launch activities. The full extent of these effects are unknown, but all of them could have a material impact on our operations and revenue.

In addition, to the extent the ongoing COVID-19 pandemic adversely affects our business and results of operations, it may also have the effect of heightening many of the other risks and uncertainties described in this "Risk Factors" section.

Risks Related to Our Reliance on Third Parties

If our collaborations were terminated or if Astellas or AstraZeneca were to prioritize other initiatives over their collaborations with us, our ability to successfully develop and commercialize our product candidates would suffer.

We have entered into collaboration agreements with respect to the development and commercialization of our lead product candidate, roxadustat, with Astellas and AstraZeneca. These agreements provide for reimbursement of our development costs by our collaboration partners and also provide for commercialization of roxadustat throughout the major territories of the world.

Our agreements with Astellas and AstraZeneca provide each of them with the right to terminate their respective agreements with us, upon the occurrence of negative clinical results, delays in the development and commercialization of our product candidates or adverse regulatory requirements or guidance. In addition, each of those agreements provides our respective partners the right to terminate any of those agreements upon written notice for convenience. The termination of any of our collaboration agreements would require us to fund and perform the further development and commercialization of roxadustat in the affected territory, or pursue another collaboration, which we may be unable to do, either of which could have an adverse effect on our business and operations. Moreover, if Astellas or AstraZeneca, or any successor entity, were to determine that their collaborations with us are no longer a strategic priority, or if either of them or a successor were to reduce their level of commitment to their collaborations with us, our ability to develop and commercialize roxadustat could suffer. In addition, our collaborations are exclusive and preclude us from entering into additional collaboration agreements with other parties in the area or field of exclusivity.

If we do not establish and maintain strategic collaborations related to our product candidates, we will bear all of the risk and costs related to the development and commercialization of any such product candidate, and we may need to seek additional financing, hire additional employees and otherwise develop expertise at significant cost. This in turn may negatively affect the development of our other product candidates as we direct resources to our most advanced product candidates.

Our collaboration partners also have certain rights to control decisions regarding the development and commercialization of our product candidates with respect to which they are providing funding. If we have a disagreement over strategy and activities with our collaboration partners, our plans for obtaining regulatory approval may be revised and negatively affect the anticipated timing and potential for success of our product candidates. Even if a product under a collaboration agreement receives regulatory approval, we will remain substantially dependent on the commercialization strategy and efforts of our collaboration partners, and, our collaboration partners have limited or no experience in commercialization of an anemia drug. If our collaboration partners are unsuccessful in their commercialization efforts, our results will be negatively affected.

With respect to our collaboration agreements for roxadustat, there are additional complexities in that our collaboration partners, Astellas and AstraZeneca, and we must reach consensus on our development programs and regulatory activities, including for the NDA in the U.S. and the Marketing Authorization Application in Europe. In addition, there are aspects of commercial operations that require cooperation among the collaboration partners, including safety data reporting. Multi-party decision-making is complex and involves significant time and effort, and there can be no assurance that the parties will cooperate or reach consensus, or that one or both of our partners will not ask to proceed independently in some or all of their respective territories or functional areas of responsibility in which the applicable collaboration partner would otherwise be obligated to cooperate with us. Any disputes or lack of cooperation with us by either Astellas or AstraZeneca, or both, may negatively impact the timing or success of our regulatory approval applications.

We intend to conduct proprietary research programs in specific disease areas that are not covered by our collaboration agreements. Our pursuit of such opportunities could, however, result in conflicts with our collaboration partners in the event that any of our collaboration partners takes the position that our internal activities overlap with those areas that are exclusive to our collaboration agreements. Moreover, disagreements with our collaboration partners could develop over rights to our intellectual property, including the enforcement of those rights. In addition, our collaboration agreements may have provisions that give rise to disputes regarding the rights and obligations of the parties. Any conflict with our collaboration partners could lead to the termination of our collaboration agreements, delay collaborative activities, reduce our ability to renew agreements or obtain future collaboration agreements or result in litigation or arbitration and would negatively impact our relationship with existing collaboration partners, and could impact our commercial results.

Certain of our collaboration partners could also become our competitors in the future. If our collaboration partners develop competing products, fail to obtain necessary regulatory approvals, terminate their agreements with us prematurely or fail to devote sufficient resources to the development and commercialization of our product candidates, the development and commercialization of our product candidates and products could be delayed.

If our preclinical and clinical trial contractors do not properly perform their agreed upon obligations, we may not be able to obtain or may be delayed in receiving regulatory approvals for our product candidates.

We rely heavily on university, hospital, dialysis centers and other institutions and third parties, including the principal investigators and their staff, to carry out our clinical trials in accordance with our clinical protocols and designs. We also rely on a number of third-party CROs to assist in undertaking, managing, monitoring and executing our ongoing clinical trials, including those for roxadustat. We expect to continue to rely on CROs, clinical data management organizations, medical institutions and clinical investigators to conduct our development efforts in the future, including our continued development of roxadustat. We compete with many other companies for the resources of these third parties, and large pharmaceutical companies often have significantly more extensive agreements and relationships with such third-party providers, and such third-party providers may prioritize the requirements of such large pharmaceutical companies over ours. The third parties on whom we rely may terminate their engagements with us at any time, which may cause delay in the development and commercialization of our product candidates. If any such third party terminates its engagement with us or fails to perform as agreed, we may be required to enter into alternative arrangements, which would result in significant cost and delay to our product development program. Moreover, our agreements with such third parties generally do not provide assurances regarding employee turnover and availability, which may cause interruptions in the research on our product candidates by such third parties.

Moreover, while our reliance on these third parties for certain development and management activities will reduce our control over these activities, it will not relieve us of our responsibilities. For example, the FDA and foreign regulatory authorities require compliance with regulations and standards, including GCP requirements for designing, conducting, monitoring, recording, analyzing and reporting the results of clinical trials to ensure that the data and results from trials are credible and accurate and that the rights, integrity and confidentiality of trial participants are protected. Although we rely on third parties to conduct our clinical trials, we, as the sponsor, remain responsible for ensuring that each of these clinical trials is conducted in accordance with its general investigational plan and protocol under legal and regulatory requirements, including GCP. Regulatory authorities enforce these GCP requirements through periodic inspections of trial sponsors, principal investigators and trial sites.

If any of our CROs, trial sites, principal investigators or other third parties fail to comply with applicable GCP requirements, other regulations, trial protocol or other requirements under their agreements with us, the quality or accuracy of the data they obtain may be compromised or unreliable, and the trials of our product candidates may not meet regulatory requirements. If trials do not meet regulatory requirements or if these third parties need to be replaced, the development of our product candidates may be delayed, suspended or terminated, regulatory authorities may require us to exclude the use of patient data from our approval applications or perform additional clinical trials before approving our marketing applications. Regulatory authorities may even reject our application for approval or refuse to accept our future applications for an extended period of time. We cannot assure that upon inspection by a regulatory authority, such regulatory authority will determine that any of our clinical trials comply with GCP requirements or that our results may be used in support of our regulatory submissions. If any of these events occur, we may not be able to obtain regulatory approval for our product candidates on a timely basis, at a reasonable cost, or at all.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 641 of 1730

We currently rely, and expect to continue to rely, on third parties to conduct many aspects of our product manufacturing and distribution, and these third parties may terminate these agreements or not perform satisfactorily.

We do not have operating manufacturing facilities at this time other than our roxadustat manufacturing facilities in China, and our current commercial manufacturing plans in China are not expected to satisfy the requirements necessary to support development and commercialization outside of China. Other than in and for China specifically, we do not expect to independently manufacture our products. We currently rely, and expect to continue to rely, on third parties to scale-up, manufacture and supply roxadustat and our other product candidates outside of China. We rely on third parties for distribution, including our collaboration partners and their vendors, except in China where we have established a jointly owned entity with AstraZeneca to manage most of the distribution in China. Risks arising from our reliance on third-party manufacturers include:

- reduced control and additional burdens of oversight as a result of using third-party manufacturers and distributors for all aspects of
 manufacturing activities, including regulatory compliance and quality control and quality assurance;
- termination of manufacturing agreements, termination fees associated with such termination, or nonrenewal of manufacturing agreements with third parties may negatively impact our planned development and commercialization activities;
- the possible misappropriation of our proprietary technology, including our trade secrets and know-how; and
- disruptions to the operations of our third-party manufacturers, distributors or suppliers unrelated to our product, including the merger, acquisition, or bankruptcy of a manufacturer or supplier or a catastrophic event, including disruption resulting from the COVID-19 pandemic, affecting our manufacturers, distributors or suppliers.

Any of these events could lead to development delays or failure to obtain regulatory approval or affect our ability to successfully commercialize our product candidates. Some of these events could be the basis for action by the FDA or another regulatory authority, including injunction, recall, seizure or total or partial suspension of production.

The facilities used by our contract manufacturer to manufacture our product candidates must pass inspections by the FDA and other regulatory authorities. Although, except for China, we do not control the manufacturing operations of, and expect to remain completely dependent on, our contract manufacturers for manufacture of drug substance and finished drug product, we are ultimately responsible for ensuring that our product candidates are manufactured in compliance with cGMP requirements. If our contract manufacturers cannot successfully manufacture material that conforms to our or our collaboration partners' specifications, or the regulatory requirements of the FDA or other regulatory authorities, we may not be able to secure and/or maintain regulatory approval for our product candidates and our development or commercialization plans may be delayed. In addition, we have no control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel. In addition, although our longer-term agreements are expected to provide for requirements to meet our quantity and quality requirements to manufacture our products candidates for clinical studies and commercial sale, we will have minimal direct control over the ability of our contract manufacturers to maintain adequate quality control, quality assurance and qualified personnel and we expect to rely on our audit rights to ensure that those qualifications are maintained to meet our requirements. If our contract manufacturers' facilities do not pass inspection by regulatory authorities, or if regulatory authorities do not approve these facilities for the manufacture of our products, or withdraw any such approval in the future, we would need to identify and qualify alternative manufacturing facilities, which would significantly impact our ability to develop, obtain regulatory approval for or market our products, if approved. Moreover, any failure of our third-party manufacturers, to comply with applicable regulations could result in sanctions being imposed on us or adverse regulatory consequences, including clinical holds, warnings or untitled letters, fines, injunctions, civil penalties, delays, suspension or withdrawal of approvals, license revocation, seizures or recalls of product candidates or products, operating restrictions and criminal prosecutions, any of which would be expected to significantly and adversely affect supplies of our products to us and our collaboration partners.

We have entered into a commercial supply agreement for the manufacture of pamrevlumab with Samsung Biologics Co., Ltd. However, we may experience delays or technical problems associated with technology transfer of the manufacturing process to Samsung and the qualification and scale-up thereof. We have made certain manufacturing commitments to Samsung Biologics Co., Ltd., and there is a risk we will not require the quantities of pamrevlumab we have committed to, particularly if we cease some of our pamrevlumab clinical trials. In addition, our product candidates and any products that we may develop may compete with other product candidates and products for access and prioritization to manufacture. Certain third-party manufacturers may be contractually prohibited from manufacturing our product due to non-compete agreements with our competitors or a commitment to grant another party priority relative to our products. There are a limited number of third-party manufacturers that operate under cGMP and that might be capable of manufacturing to meet our requirements. Due to the limited number of third-party manufacturers with the contractual freedom, expertise, required regulatory approvals and facilities to manufacture our products on a commercial scale, identifying and qualifying a replacement third-party manufacturer would be expensive and time-consuming and may cause delay or interruptions in the production of our product candidates or products, which in turn may delay, prevent or impair our development and commercialization efforts.

We have a letter agreement with IRIX Pharmaceuticals, Inc. ("IRIX"), a third-party manufacturer that we have used in the past, pursuant to which we agreed to negotiate a single source manufacturing agreement that included a right of first negotiation for the cGMP manufacture of HIF-PH inhibitors, including roxadustat, provided that IRIX is able to match any third-party bids within 5%. The exclusive right to manufacture extends for five years after approval of an NDA for those compounds, and any agreement would provide that no minimum amounts would be specified until appropriate by forecast and that we and a commercialization partner would have the rights to contract with independent third parties that exceed IRIX's internal manufacturing capabilities or in the event that we or our commercialization partner determines for reasons of continuity of supply and security that such a need exists, provided that IRIX would supply no less than 65% of the product if it is able to provide this level of supply. Subsequent to the letter agreement, we and IRIX have entered into several additional service agreements. IRIX has requested in writing that we honor the letter agreement with respect to the single source manufacturing agreement, and if we were to enter into any such exclusive manufacturing agreement, there can be no assurance that IRIX will not assert a claim for right to manufacture roxadustat or that IRIX could manufacture roxadustat successfully and in accordance with applicable regulations for a commercial product and the specifications of our collaboration partners. In 2015, Patheon Pharmaceuticals Inc., a business unit of DPx Holdings B.V., acquired IRIX, and in 2017, ThermoFisher Scientific Inc. acquired Patheon Pharmaceuticals Inc.

If any third-party manufacturer terminates its engagement with us or fails to perform as agreed, we may be required to find replacement manufacturers, which would result in significant cost and delay to our development programs. Although we believe that there are several potential alternative manufacturers who could manufacture our product candidates, we may incur significant delays and added costs in identifying, qualifying and contracting with any such third party or potential second source manufacturer. In any event, with any third-party manufacturer we expect to enter into technical transfer agreements and share our know-how with the third-party manufacturer, which can be time-consuming and may result in delays. These delays could result in a suspension or delay of marketing roxadustat.

Certain components of our products are acquired from single-source suppliers or without long-term supply agreements. The loss of these suppliers, or their failure to supply, would materially and adversely affect our business.

We do not have an alternative supplier of certain components of our product candidates. We may be unable to enter into long-term commercial supply arrangements for some of our products, or do so on commercially reasonable terms, which could have a material adverse impact upon our business. In addition, we currently rely on our contract manufacturers to purchase from third-party suppliers some of the materials necessary to produce our product candidates. We do not have direct control over the acquisition of those materials by our contract manufacturers.

The logistics of our supply chain, which include shipment of materials and intermediates from countries such as China and India add additional time and risk (including risk of loss) to the manufacture of our product candidates. While we have in the past maintained sufficient inventory of materials, active pharmaceutical ingredients ("API"), and drug product to meet our and our collaboration partners' needs for roxadustat to date, the lead-time and regulatory approvals required to source from and into countries outside of the U.S. increase the risk of delay and potential shortages of supply.

Risks Related to Our Intellectual Property

If our efforts to protect our proprietary technologies are not adequate, we may not be able to compete effectively in our market.

We rely upon a combination of patents, trade secret protection, and contractual arrangements to protect the intellectual property related to our technologies. We will only be able to protect our products and proprietary information and technology by preventing unauthorized use by third parties to the extent that our patents, trade secrets, and contractual position allow us to do so. Any disclosure to or misappropriation by third parties of our trade secrets or confidential information could compromise our competitive position. Moreover, we are involved in, have in the past been involved in, and may in the future be involved in legal proceedings involving our intellectual property initiated by third parties, which proceedings can be associated with significant costs and commitment of management time and attention. As our product candidates continue in development, third parties have attempted and may again attempt to challenge the validity and enforceability of our patents and proprietary information and technologies.

We also are involved in, have in the past been involved in, and may in the future be involved in initiating legal or administrative proceedings involving the product candidates and intellectual property of our competitors. These proceedings can result in significant costs and commitment of management time and attention, and there can be no assurance that our efforts would be successful in preventing or limiting the ability of our competitors to market competing products.

Composition-of-matter patents relating to the API are generally considered to be the strongest form of intellectual property protection for pharmaceutical products, as such patents provide protection not limited to any one method of use. Method-of-use patents protect the use of a product for the specified method(s), and do not prevent a competitor from making and marketing a product that is identical to our product for an indication that is outside the scope of the patented method. We rely on a combination of these and other types of patents to protect our product candidates, and there can be no assurance that our intellectual property will create and sustain the competitive position of our product candidates.

Biotechnology and pharmaceutical product patents involve highly complex legal and scientific questions and can be uncertain. Any patent applications that we own or license may fail to result in issued patents. Even if patents do successfully issue from our applications, third parties may challenge their validity or enforceability, which may result in such patents being narrowed, invalidated, or held unenforceable. Even if our patents and patent applications are not challenged by third parties, those patents and patent applications may not prevent others from designing around our claims and may not otherwise adequately protect our product candidates. If the breadth or strength of protection provided by the patents and patent applications we hold with respect to our product candidates is threatened, competitors with significantly greater resources could threaten our ability to commercialize our product candidates. Discoveries are generally published in the scientific literature well after their actual development, and patent applications in the U.S. and other countries are typically not published until 18 months after their filing, and in some cases are never published. Therefore, we cannot be certain that we or our licensors were the first to make the inventions claimed in our owned and licensed patents or patent applications, or that we or our licensors were the first to file for patent protection covering such inventions. Subject to meeting other requirements for patentability, for U.S. patent applications filed prior to March 16, 2013, the first to invent the claimed invention is entitled to receive patent protection for that invention while, outside the U.S., the first to file a patent application encompassing the invention is entitled to patent protection for the invention. The U.S. moved to a "first to file" system under the Leahy-Smith America Invents Act, effective March 16, 2013. This system also includes procedures for challenging issued patents and pending patent applications, which creates additional uncertainty. We have, are, and may again become involved in opposition or interference proceedings challenging our patents and patent applications or the patents and patent applications of others, and the outcome of any such proceedings are highly uncertain. An unfavorable outcome in any such proceedings could reduce the scope of or invalidate our patent rights, allow third parties to commercialize our technology and compete directly with us, or result in our inability to manufacture, develop or commercialize our product candidates without infringing the patent rights of others.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 644 of 1730

In addition to the protection afforded by patents, we seek to rely on trade secret protection and confidentiality agreements to protect proprietary know-how, information, or technology that is not covered by our patents. Although our agreements require all of our employees to acknowledge ownership by us of inventions conceived as a result of employment from the point of conception and, to the extent necessary, perfect such ownership by assignment, and we require all of our employees, consultants, advisors and any third parties who have access to our trade secrets, proprietary know-how and other confidential information and technology to enter into appropriate confidentiality agreements, we cannot be certain that our trade secrets, proprietary know-how and other confidential information and technology will not be subject to unauthorized disclosure or that our competitors will not otherwise gain access to or independently develop substantially equivalent trade secrets, proprietary know-how and other information and technology. Furthermore, the laws of some foreign countries, in particular, China, where we have operations, do not protect proprietary rights to the same extent or in the same manner as the laws of the U.S. As a result, we may encounter significant problems in protecting and defending our intellectual property globally. If we are unable to prevent unauthorized disclosure of our intellectual property related to our product candidates and technology to third parties, we may not be able to establish or maintain a competitive advantage in our market, which could materially adversely affect our business and operations.

Intellectual property disputes may be costly, time consuming, and may negatively affect our competitive position.

Our commercial success may depend on our avoiding infringement of the patents and other proprietary rights of third parties as well as on enforcing our patents and other proprietary rights against third parties. Pharmaceutical and biotechnology intellectual property disputes are characterized by complex, lengthy and expensive litigation over patents and other intellectual property rights. We have initiated and may again initiate or become party to or be threatened with future litigation or other proceedings regarding intellectual property rights with respect to our product candidates and competing products.

As our product candidates progress toward commercialization, our collaboration partners or we may be subject to patent infringement claims from third parties. We attempt to ensure that our product candidates do not infringe third-party patents and other proprietary rights. However, the patent landscape in competitive product areas is highly complex, and there may be patents of third parties of which we are unaware that may result in claims of infringement. Accordingly, there can be no assurance that our product candidates do not infringe proprietary rights of third parties, and parties making claims against us may seek and obtain injunctive or other equitable relief, which could potentially block further efforts to develop and commercialize our product candidates including roxadustat or pamrevlumab. Any litigation involving defense against claims of infringement, regardless of the merit of such claims, would involve substantial litigation expense and would be a substantial diversion of management time.

We may consider administrative proceedings and other means for challenging third-party patents and patent applications. An unfavorable outcome in any such challenge could require us to cease using the related technology and to attempt to license rights to it from the prevailing third party, which may not be available on commercially reasonable terms, if at all, in which case our business could be harmed.

We intend, if necessary, to vigorously enforce our intellectual property in order to protect the proprietary position of our product candidates, including roxadustat and pamrevlumab. In addition, our collaboration partners who have been granted licenses to our patents may also have rights related to enforcement of those patents. Active efforts to enforce our patents by us or by our partners may include litigation, administrative proceedings, or both, depending on the potential benefits that might be available from those actions and the costs associated with undertaking those efforts against third parties. We carefully review and monitor publicly available information regarding products that may be competitive with our product candidates and assert our intellectual property rights where appropriate.

Third parties have challenged and may again challenge our patents and patent applications, through interference, reexamination, *inter partes* review, and post-grant review proceedings before the U.S. Patent and Trademark Office ("USPTO") or through comparable proceedings in other territories. For example, various legal challenges against our HIF anemia-related technologies patent portfolio have been filed in several territories including in Europe, the United Kingdom, Canada, and Japan,. Regardless of the final outcome of these actions, the potential narrowing or revocation of any of the HIF anemia-related technology patents does not affect our exclusivity for roxadustat or our freedom-to-operate with respect to use of roxadustat for the treatment of anemia in these or other territories. A settlement has been reached in the litigation in Canada, resulting in the discontinuance of the action and leaving FibroGen's Canadian patents valid and enforceable.

In April 2020, in response to an invalidation action brought against certain of our United Kingdom patents by Akebia, the United Kingdom court handed down a decision invalidating United Kingdom designations of European Patent Nos. 1463823, 1633333, 2298301, 2322153, and 2322155. The United Kingdom designation to European Patent No. 2289531 was held to be valid in amended form, but not infringed by Akebia. We and our partner Astellas have filed an appeal of the decision in the United Kingdom Court of Appeal.

In May 2020, oppositions were filed against our European Patent No. 2872488 (the "'488 Patent"), which claims a crystalline form of roxadustat, and against our European Patent No. 3003284 (the "'284 Patent"), which claims photostable formulations of roxadustat. Final resolution of the opposition proceedings will take time, and we cannot be assured of the breadth of the claims that will remain in the '488 Patent or '284 Patent, or that either or both of the patents will not be revoked in their entirety.

Furthermore, there is a risk that any public announcements concerning the status or outcomes of intellectual property litigation or administrative proceedings may adversely affect the price of our stock. If securities analysts or our investors interpret such status or outcomes as negative or otherwise creating uncertainty, our common stock price may be adversely affected.

Our reliance on third parties and agreements with collaboration partners requires us to share our trade secrets, which increases the possibility that a competitor may discover them or that our trade secrets will be misappropriated or disclosed.

Our reliance on third-party contractors to develop and manufacture our product candidates is based upon agreements that limit the rights of the third parties to use or disclose our confidential information, including our trade secrets and know-how. Despite the contractual provisions, the need to share trade secrets and other confidential information increases the risk that such trade secrets and information are disclosed or used, even if unintentionally, in violation of these agreements. In the highly competitive markets in which our product candidates are expected to compete, protecting our trade secrets, including our strategies for addressing competing products, is imperative, and any unauthorized use or disclosure could impair our competitive position and may have a material adverse effect on our business and operations.

In addition, our collaboration partners are larger, more complex organizations than ours, and the risk of inadvertent disclosure of our proprietary information may be increased despite their internal procedures and contractual obligations that we have in place with them. Despite our efforts to protect our trade secrets and other confidential information, a competitor's discovery of such trade secrets and information could impair our competitive position and have an adverse impact on our business.

The cost of maintaining our patent protection is high and requires continuous review and diligence. We may not be able to effectively maintain our intellectual property position throughout the major markets of the world.

The USPTO and foreign patent authorities require maintenance fees and payments as well as continued compliance with a number of procedural and documentary requirements. Noncompliance may result in abandonment or lapse of the subject patent or patent application, resulting in partial or complete loss of patent rights in the relevant jurisdiction. Non-compliance may result in reduced royalty payments for lack of patent coverage in a particular jurisdiction from our collaboration partners or may result in competition, either of which could have a material adverse effect on our business.

We have made, and will continue to make, certain strategic decisions in balancing costs and the potential protection afforded by the patent laws of certain countries. As a result, we may not be able to prevent third parties from practicing our inventions in all countries throughout the world, or from selling or importing products made using our inventions in and into the U.S. or other countries. Third parties may use our technologies in territories in which we have not obtained patent protection to develop their own products and, further, may infringe our patents in territories which provide inadequate enforcement mechanisms, even if we have patent protection. Such third-party products may compete with our product candidates, and our patents or other intellectual property rights may not be effective or sufficient to prevent them from competing.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 646 of 1730

The laws of some foreign countries do not protect proprietary rights to the same extent as do the laws of the U.S., and we may encounter significant problems in securing and defending our intellectual property rights outside the U.S.

Many companies have encountered significant problems in protecting and defending intellectual property rights in certain countries. The legal systems of certain countries do not always favor the enforcement of patents, trade secrets, and other intellectual property rights, particularly those relating to pharmaceutical and biotechnology products, which could make it difficult for us to stop infringement of our patents, misappropriation of our trade secrets, or marketing of competing products in violation of our proprietary rights. In China, our intended establishment of significant operations will depend in substantial part on our ability to effectively enforce our intellectual property rights in that country. Proceedings to enforce our intellectual property rights in foreign countries could result in substantial costs and divert our efforts and attention from other aspects of our business, and could put our patents in these territories at risk of being invalidated or interpreted narrowly, or our patent applications at risk of not being granted, and could provoke third parties to assert claims against us. We may not prevail in all legal or other proceedings that we may initiate and, if we were to prevail, the damages or other remedies awarded, if any, may not be commercially meaningful. Accordingly, our efforts to enforce our intellectual property rights around the world may be inadequate to obtain a significant commercial advantage from the intellectual property that we develop or license.

Intellectual property rights do not address all potential threats to any competitive advantage we may have.

The degree of future protection afforded by our intellectual property rights is uncertain because intellectual property rights have limitations, and intellectual property rights may not adequately protect our business or permit us to maintain our competitive advantage. The following examples are illustrative:

- Others may be able to make compounds that are the same as or similar to our current or future product candidates but that are not covered by the claims of the patents that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to make the inventions covered by the issued patent or pending patent application that we own or have exclusively licensed.
- We or any of our licensors or strategic partners might not have been the first to file patent applications covering certain of our inventions.
- Others may independently develop similar or alternative technologies or duplicate any of our technologies without infringing our intellectual property rights.
- The prosecution of our pending patent applications may not result in granted patents.
- Granted patents that we own or have exclusively licensed may not provide us with any competitive advantages, or may be held invalid or unenforceable, as a result of legal challenges by our competitors.
- Patent protection on our product candidates may expire before we are able to develop and commercialize the product, or before we are able to recover our investment in the product.
- Our competitors might conduct research and development activities in the U.S. and other countries that provide a safe harbor from patent infringement claims for such activities, as well as in countries in which we do not have patent rights, and may then use the information learned from such activities to develop competitive products for sale in markets where we intend to market our product candidates.

The existence of counterfeit pharmaceutical products in pharmaceutical markets may compromise our brand and reputation and have a material adverse effect on our business, operations and prospects.

Counterfeit products, including counterfeit pharmaceutical products, are a significant problem, particularly in China. Counterfeit pharmaceuticals are products sold or used for research under the same or similar names, or similar mechanism of action or product class, but which are sold without proper licenses or approvals, and are often lower cost, lower quality, different potency, or have different ingredients or formulations, and have the potential to damage the reputation for quality and effectiveness of the genuine product. Such products may be used for indications or purposes that are not recommended or approved or for which there is no data or inadequate data with regard to safety or efficacy. Such products divert sales from genuine products. If counterfeit pharmaceuticals illegally sold or used for research result in adverse events or side effects to consumers, we may be associated with any negative publicity resulting from such incidents. Consumers may buy counterfeit pharmaceuticals that are in direct competition with our pharmaceuticals, which could have an adverse impact on our revenues, business and results of operations. In addition, the use of counterfeit products could be used in non-clinical or clinical studies, or could otherwise produce undesirable side effects or adverse events that may be attributed to our products as well, which could cause us or regulatory authorities to interrupt, delay or halt clinical trials and could result in the delay or denial of regulatory approval by the FDA or other regulatory authorities and potential product liability claims. With respect to China, although the government has recently been increasingly active in policing counterfeit pharmaceuticals, there is not yet an effective counterfeit pharmaceutical regulation control and enforcement system in China. As a result, we may not be able to prevent third parties from selling or purporting to sell our products in China. The proliferation of counterfeit pharmaceuticals has grown in recent years and may continue to grow in the future. The existence of and any increase in the sales and production of counterfeit pharmaceuticals, or the technological capabilities of counterfeiters, could negatively impact our revenues, brand reputation, business and results of operations.

Risks Related to Government Regulation

The regulatory approval process is highly uncertain and we may not obtain regulatory approval for our product candidates.

The time required to obtain approval by the FDA and comparable foreign regulatory authorities is unpredictable, but typically takes many years following the commencement of preclinical studies and clinical trials and depends upon numerous factors, including the substantial discretion of the regulatory authorities. In addition, approval policies, regulations, or the type and amount of clinical data necessary to gain approval may change during the course of a product candidate's clinical development and may vary among jurisdictions. Except for roxadustat in China, Japan, and Chile for patients on dialysis and not on dialysis, we have not obtained regulatory approval for any product candidate, and it is possible that neither roxadustat nor pamrevlumab, nor any future product candidates we may discover, in-license or acquire and seek to develop in the future, will obtain regulatory approval in additional countries.

Our product candidates could fail to receive regulatory approval from the FDA or other regulatory authorities for many reasons, including:

- disagreement over the design or implementation of our clinical trials;
- failure to demonstrate that a product candidate is safe and effective for its proposed indication;
- failure of clinical trials to meet the level of statistical significance required for approval;
- failure to demonstrate that a product candidate's clinical and other benefits outweigh its safety risks;
- disagreement over our interpretation of data from preclinical studies or clinical trials;
- disagreement over whether to accept efficacy results from clinical trial sites outside the U.S. where the standard of care is potentially different from that in the U.S.;
- the insufficiency of data collected from clinical trials of our present or future product candidates to support the submission and filing of an NDA or other submission or to obtain regulatory approval;
- disapproval of the manufacturing processes or facilities of either our manufacturing plant or third party manufacturers with whom we contract for clinical and commercial supplies; or
- · changes in the approval policies or regulations that render our preclinical and clinical data insufficient for approval.

The FDA or other regulatory authorities may require more information, including additional preclinical or clinical data to support approval, or different analyses, which may delay or prevent approval and our commercialization plans, or we may decide to abandon the development program altogether. Even if we do obtain regulatory approval, our product candidates may be approved for fewer or more limited indications than we request, approval may be contingent on the performance of costly post-marketing clinical trials, or approval may require labeling that does not include the labeling claims necessary or desirable for the successful commercialization of that product candidate. In addition, if our product candidates produce undesirable side effects or safety issues, the FDA may require the establishment of REMS or other regulatory authorities may require the establishment of a similar strategy, that may restrict distribution of our approved products, if any, and impose burdensome implementation requirements on us. Any of the foregoing scenarios could materially harm the commercial prospects for our product candidates.

Even if we believe our clinical trials are successful, regulatory authorities may not agree that our completed clinical trials provide adequate data on safety or efficacy. Approval by one regulatory authority does not ensure approval by any other regulatory authority. However, a failure or delay in obtaining regulatory approval in one country may have a negative effect on the regulatory process in others. We may not be able to file for regulatory approvals and even if we file we may not receive the necessary approvals to commercialize our product candidates in any market.

Our current and future relationships with customers, physicians, and third-party payors are subject to healthcare fraud and abuse laws, false claims laws, transparency laws, privacy and security laws, and other regulations. If we are unable to comply with such laws, we could face substantial penalties.

Our current and future relationships with customers, physicians, and third-party payors are subject to health care laws and regulations, which may constrain the business or financial arrangements and relationships through which we research, as well as, sell, market and distribute any products for which we obtain marketing approval. If we obtain approval in the U.S. for any of our product candidates, the regulatory requirements applicable to our operations, in particular our sales and marketing efforts, will increase significantly with respect to our operations and the potential for administrative, civil and criminal enforcement by the federal government and the states and foreign governments will increase with respect to the conduct of our business. The laws that may affect our operations in the U.S. include:

- the federal Anti-Kickback Statute, which prohibits, among other things, persons from knowingly and willfully soliciting, receiving, offering
 or paying remuneration, directly or indirectly, to induce, or in return for, the purchase or recommendation of an item or service reimbursable
 under a federal healthcare program, such as the Medicare and Medicaid programs;
- federal civil and criminal false claims laws and civil monetary penalty laws, which prohibit, among other things, individuals or entities from knowingly presenting, or causing to be presented, claims for payment from Medicare, Medicaid, or other third-party payors that are false or fraudulent;
- the Health Insurance Portability and Accountability Act of 1996 ("HIPAA"), which created new federal criminal statutes that prohibit executing a scheme to defraud any healthcare benefit program and making false statements relating to healthcare matters;
- HIPAA, as amended by Health Information Technology and Clinical Health Act, and its implementing regulations, which imposes certain
 requirements on certain covered healthcare providers, health plans, and healthcare clearinghouses as well as their respective business
 associates that perform services for them that involve the use, or disclosure of, individually identifiable health information as well as their
 covered subcontractors relating to the privacy, security, and transmission of individually identifiable health information;
- the federal physician sunshine requirements under the Patient Protection and Affordable Care Act, as amended by the Health Care and
 Education Reconciliation Act of 2010 (collectively, the "PPACA"), which requires manufacturers of drugs, devices, biologics, and medical
 supplies to report annually to the Centers for Medicare & Medicaid Services ("CMS"), information related to payments and other transfers
 of value to physicians, other healthcare providers, and teaching hospitals, and ownership and investment interests held by physicians and
 other healthcare providers and their immediate family members;

- foreign and state law equivalents of each of the above federal laws, such as the U.S. Foreign Corrupt Practices Act ("FCPA"), anti-kickback and false claims laws that may apply to items or services reimbursed by any third-party payor, including commercial insurers; state laws that require pharmaceutical companies to comply with the pharmaceutical industry's voluntary compliance guidelines and the applicable compliance guidance promulgated by the federal government, or otherwise restrict payments that may be made to healthcare providers and other potential referral sources; state laws that require drug manufacturers to report information related to payments and other transfers of value to physicians and other healthcare providers or marketing expenditures; and state laws governing the privacy and security of health information in certain circumstances, many of which differ from each other in significant ways, thus complicating compliance efforts; and
- the Trade Agreements Act ("TAA"), which requires that drugs sold to the U.S. Government must be manufactured in the U.S. or in TAA approved and designated countries. Drugs manufactured in countries not approved under the TAA, may not be sold to the U.S. without specific regulatory approval. We have little experience with this regulation and there is a risk that drugs made from Chinese-made API may not be sold to an entity of the U.S. such as the Veterans Health Administration ("VA") due to our inability to obtain regulatory approval. While there have been recent VA policy changes that appear to allow for sale of drugs from non-TAA approved countries, this policy may change or there may be additional policies or legislation that affect our ability to sell drug to the U.S. Government.

The scope of these laws and our lack of experience in establishing the compliance programs necessary to comply with this complex and evolving regulatory environment increases the risks that we may unknowingly violate the applicable laws and regulations. If our operations are found to be in violation of any of such laws or any other governmental regulations that apply to us, we may be subject to significant penalties, including administrative, civil and criminal penalties, damages, fines, disgorgement, the curtailment or restructuring of our operations, the exclusion from participation in federal and state healthcare programs and imprisonment, any of which could materially adversely affect our ability to operate our business and our financial results.

Even if resolved in our favor, litigation or other legal proceedings relating to healthcare laws and regulations may cause us to incur significant expenses and could distract our technical and management personnel from their normal responsibilities. In addition, there could be public announcements of the results of hearings, motions or other interim proceedings or developments. If securities analysts or investors perceive these results to be negative, it could have a substantial adverse effect on the price of our common shares. Such litigation or proceedings could substantially increase our operating losses and reduce the resources available for development, manufacturing, sales, marketing or distribution activities. Uncertainties resulting from the initiation and continuation of litigation or other proceedings relating to applicable healthcare laws and regulations could have a material adverse effect on our ability to compete in the marketplace.

We are subject to laws and regulations governing corruption, which will require us to maintain costly compliance programs.

We must comply with a wide range of laws and regulations to prevent corruption, bribery, and other unethical business practices, including the FCPA, anti-bribery and anti-corruption laws in other countries, particularly China. The implementation and maintenance of compliance programs is costly and such programs may be difficult to enforce, particularly where reliance on third parties is required.

Anti-bribery laws prohibit us, our employees, and some of our agents or representatives from offering or providing any personal benefit to covered government officials to influence their performance of their duties or induce them to serve interests other than the missions of the public organizations in which they serve. Certain commercial bribery rules also prohibit offering or providing any personal benefit to employees and representatives of commercial companies to influence their performance of their duties or induce them to serve interests other than their employers. The FCPA also obligates companies whose securities are listed in the U.S. to comply with certain accounting provisions requiring us to maintain books and records that accurately and fairly reflect all transactions of the corporation, including international subsidiaries, and devise and maintain an adequate system of internal accounting controls for international operations. The anti-bribery provisions of the FCPA are enforced primarily by the Department of Justice. The SEC is involved with enforcement of the books and records provisions of the FCPA.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 650 of 1730

Compliance with these anti-bribery laws is expensive and difficult, particularly in countries in which corruption is a recognized problem. In addition, the anti-bribery laws present particular challenges in the pharmaceutical industry because in many countries including China, hospitals are state-owned or operated by the government, and doctors and other hospital employees are considered foreign government officials. Furthermore, in certain countries (China in particular), hospitals and clinics are permitted to sell pharmaceuticals to their patients and are primary or significant distributors of pharmaceuticals. Certain payments to hospitals in connection with clinical studies, procurement of pharmaceuticals and other work have been deemed to be improper payments to government officials that have led to vigorous anti-bribery law enforcement actions and heavy fines in multiple jurisdictions, particularly in the U.S. and China.

It is not always possible to identify and deter violations, and the precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations.

In the pharmaceutical industry, corrupt practices include, among others, acceptance of kickbacks, bribes or other illegal gains or benefits by the hospitals and medical practitioners from pharmaceutical manufacturers, distributors or their third-party agents in connection with the prescription of certain pharmaceuticals. If our employees, affiliates, distributors or third-party marketing firms violate these laws or otherwise engage in illegal practices with respect to their sales or marketing of our products or other activities involving our products, we could be required to pay damages or heavy fines by multiple jurisdictions where we operate, which could materially and adversely affect our financial condition and results of operations. The Chinese government has also sponsored anti-corruption campaigns from time to time, which could have a chilling effect on any future marketing efforts by us to new hospital customers. There have been recent occurrences in which certain hospitals have denied access to sales representatives from pharmaceutical companies because the hospitals wanted to avoid the perception of corruption. If this attitude becomes widespread among our potential customers, our ability to promote our products to hospitals may be adversely affected.

As we expand our operations in China and other jurisdictions internationally, we will need to increase the scope of our compliance programs to address the risks relating to the potential for violations of the FCPA and other anti-bribery and anti-corruption laws. Our compliance programs will need to include policies addressing not only the FCPA, but also the provisions of a variety of anti-bribery and anti-corruption laws in multiple foreign jurisdictions, including China, provisions relating to books and records that apply to us as a public company, and include effective training for our personnel throughout our organization. The creation and implementation of anti-corruption compliance programs is costly and such programs are difficult to enforce, particularly where reliance on third parties is required. Violation of the FCPA and other anti-corruption laws can result in significant administrative and criminal penalties for us and our employees, including substantial fines, suspension or debarment from government contracting, prison sentences, or even the death penalty in extremely serious cases in certain countries. The SEC also may suspend or bar us from trading securities on U.S. exchanges for violation of the FCPA's accounting provisions. Even if we are not ultimately punished by government authorities, the costs of investigation and review, distraction of our personnel, legal defense costs, and harm to our reputation could be substantial and could limit our profitability or our ability to develop or commercialize our product candidates. In addition, if any of our competitors are not subject to the FCPA, they may engage in practices that will lead to their receipt of preferential treatment from foreign hospitals and enable them to secure business from foreign hospitals in ways that are unavailable to us.

We have identified material weaknesses in our internal control over financial reporting. If we are unable to remediate these, or if we otherwise fail to maintain an effective system of internal control, it may result in material misstatements in our financial statements.

Our management is responsible for establishing and maintaining adequate internal control over financial reporting and for evaluating and reporting on the effectiveness of our system of internal control. Our internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of our financial reporting and the preparation of financial statements for external reporting purposes in accordance with generally accepted accounting principles. As a public company, we are required to comply with the Sarbanes-Oxley Act and other rules that govern public companies.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 651 of 1730

As of September 30, 2020, we have identified a material weakness in the risk assessment component of internal control as we did not appropriately design and maintain an effective risk assessment process at a precise enough level to identify new and evolving risks of material misstatement to the financial statements as a result of changes in our business operation. This material weakness gave rise to the following additional control deficiencies, which we also determined to be material weaknesses. We did not design and maintain effective controls related to the timely identification of shipments associated with drug product revenue and we did not design and maintain effective controls related to the timely identification of changes in estimated variable consideration related to drug product revenue. Each of these material weaknesses could result in material misstatements in the drug product revenue, contract asset, or contract liability account balances or disclosures in our annual or interim consolidated financial statements that would not be prevented or detected. The material weaknesses described above did not result in any material misstatements of our consolidated financial statements or disclosures, but did result in immaterial out-of-period adjustments to drug product revenue related to pre-commercial shipments of drug product, contract assets and contract liabilities, and related financial statement disclosures during the quarter ended September 30, 2020.

We have developed a detailed remediation plan and are making progress to improve our related internal control over financial reporting. For further discussion of the material weaknesses identified and our remedial efforts, see Part II, Item 9A, "Controls and Procedures" in this Annual Report on Form 10-K.

Remediation efforts place a significant burden on management and add increased pressure on our financial resources and processes. If we are unable to successfully remediate our existing or any future material weaknesses or other deficiencies in our internal control over financial reporting, the accuracy and timing of our financial reporting may be adversely affected, our liquidity, our access to capital markets may be adversely affected, we may be unable to maintain or regain compliance with applicable securities laws, and the NASDAQ Stock Market LLC listing requirements, we may be subject to regulatory investigations and penalties, investors may lose confidence in our financial reporting, and our stock price may decline.

The impact of recent U.S. healthcare reform, its potential partial or full repeal, and other changes in the healthcare industry and in healthcare spending is currently unknown, and may adversely affect our business model.

The commercial potential for our approved products could be affected by changes in healthcare spending and policy in the U.S. and abroad. We operate in a highly regulated industry and new laws, regulations or judicial decisions, or new interpretations of existing laws, regulations or decisions, related to healthcare availability, the method of delivery or payment for healthcare products and services could negatively impact our business, operations and financial condition.

In the U.S., the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA") altered Medicare coverage and payments for pharmaceutical products. The legislation expanded Medicare coverage for drug purchases by the elderly and introduced a new reimbursement methodology based on average sales prices for physician-administered drugs. The MMA also provided authority for limiting the number of drugs that will be covered in any therapeutic class and as a result, we expect that there will be additional pressure to reduce costs. For example, the CMS in implementing the MMA has enacted regulations that reduced capitated payments to dialysis providers. These cost reduction initiatives and other provisions of the MMA could decrease the scope of coverage and the price that may be received for any approved dialysis products and could seriously harm our business and financial condition. While the MMA applies only to drug benefits for Medicare beneficiaries, private payors often follow Medicare coverage policies and payment limitations in setting their own reimbursement rates, and any reduction in reimbursement that results from the MMA may cause a similar reduction in payments from private payors. Similar regulations or reimbursement policies have been enacted in many international markets that could similarly impact the commercial potential for our products.

Under the Medicare Improvements for Patients and Providers Act ("MIPPA"), a basic case-mix adjusted composite, or bundled, payment system commenced in January 2011 and transitioned fully by January 2014 to a single reimbursement rate for drugs and all services furnished by renal dialysis centers for Medicare beneficiaries with end-stage renal disease. Specifically, under MIPPA the End-Stage Renal Disease Prospective Payment System (the "ESRD PPS") bundle now covers drugs, services, lab tests and supplies under a single treatment base rate for reimbursement by the CMS based on the average cost per treatment, including the cost of ESAs and IV iron doses, typically without adjustment for usage. It is unknown whether roxadustat, if approved in the U.S., will be included in the payment bundle or the timing of inclusion. Under MIPPA, agents that have no IV equivalent in the bundle are currently expected to be excluded from the bundle until 2025. If roxadustat were included in the bundle, it may reduce the price that could be charged for roxadustat, and therefore potentially limit our profitability. Based on roxadustat's differentiated mechanism of action and therapeutic effects, and discussions with our collaboration partner, we currently believe that roxadustat might not initially be included in the bundle and would instead be eligible for a Transitional Drug Add-on Payment Adjustment ("TDAPA") for a 24-month period. At the 24-month mark, CMS would determine if the TDAPA period should be extended for roxadustat or ended. When the TDAPA period ends, CMS will determine if roxadustat should be included in the bundle and, if so, what changes to the ESRD PPS reimbursement should be made. If roxadustat is included in the ESRD PPS bundle, it may have an impact on roxadustat pricing within Dialysis Organizations. If roxadustat is not included in the bundle after the TDAPA period, and would therefore be reimbursed outside of the bundle, it may potentially limit further market penetration of roxadustat. We currently expect roxadustat to be granted TDAPA designation either July 1 or October 1 of 2021. However, there is a risk that we do not receive TDAPA designation, or when we expect it, in which case, there would be a significant impact on roxadustat revenue in 2021, or until TDAPA designation is granted.

In March 2010, the PPACA was passed, which substantially changed the way healthcare is financed by both governmental and private payors in the U.S. There remain judicial and Congressional challenges to certain aspects of the PPACA. For example, the Tax Cuts and Jobs Act of 2017, (the "Tax Act"), was enacted, which includes a provision that repealed, effective January 1, 2019, the tax-based shared responsibility payment imposed by the PPACA on certain individuals who fail to maintain qualifying health coverage for all or part of a year that is commonly referred to as the "individual mandate." In addition, the 2020 federal spending package permanently eliminates, effective January 1, 2020, the PPACA-mandated "Cadillac" tax on high-cost employer-sponsored health coverage and medical device tax and, effective January 1, 2021, also eliminated the health insurer tax. Additionally, on December 14, 2018, a Texas U.S. District Court Judge ruled that the PPACA is unconstitutional in its entirety because the "individual mandate" was repealed by Congress as part of the Tax Act. Additionally, on December 18, 2019, the U.S. Court of Appeals for the 5th Circuit upheld the District Court ruling that the individual mandate was unconstitutional and remanded the case back to the District Court to determine whether the remaining provisions of the PPACA are invalid as well. The U.S. Supreme Court is currently reviewing this case, but it is unknown when a decision will be reached. Although the U.S. Supreme Court has yet ruled on the constitutionality of the PPACA, on January 28, 2021, President Biden issued an executive order to initiate a special enrollment period from February 15, 2021 through May 15, 2021 for purposes of obtaining health insurance coverage through the PPACA marketplace. The executive order also instructs certain governmental agencies to review and reconsider their existing policies and rules that limit access to healthcare, including among others, reexamining Medicaid demonstration projects and waiver programs that include work requirements, and policies that create unnecessary barriers to obtaining access to health insurance coverage through Medicaid or the PPACA. It is unclear how the U.S. Supreme Court ruling, other such litigation, and the healthcare reform measures of the Biden administration will impact the PPACA and our business.

Further, in the U.S. there has been heightened governmental scrutiny over the manner in which manufacturers set prices for their marketed products, which has resulted in several Congressional inquiries and proposed and enacted federal and state legislation designed to, among other things, bring more transparency to drug pricing, reduce the cost of prescription drugs under government payor programs, and review the relationship between pricing and manufacturer patient programs. At the federal level, the Trump administration used several means to propose or implement drug pricing reform, including through federal budget proposals, executive orders and policy initiatives. For example, on July 24, 2020 and September 13, 2020, the Trump administration announced several executive orders related to prescription drug pricing that attempt to implement several of the administration's proposals. The FDA also released a final rule, effective November 30, 2020, implementing a portion of the importation executive order providing guidance for states to build and submit importation plans for drugs from Canada. Further, on November 20, 2020, HHS finalized a regulation removing safe harbor protection for price reductions from pharmaceutical manufacturers to plan sponsors under Part D, either directly or through pharmacy benefit managers, unless the price reduction is required by law. The implementation of the rule has been delayed by the Biden administration from January 1, 2022 to January 1, 2023 in response to ongoing litigation. The rule also creates a new safe harbor for price reductions reflected at the point-of-sale, as well as a new safe harbor for certain fixed fee arrangements between pharmacy benefit managers and manufacturers, the implementation of which have also been delayed pending review by the Biden administration until March 22, 2021. On November 20, 2020, CMS issued an interim final rule implementing President Trump's Most Favored Nation executive order, which would tie Medicare Part B payments for certain physician-administered drugs to the lowest price paid in other economically advanced countries, effective January 1, 2021. On December 28, 2020, the U.S. District Court in Northern California issued a nationwide preliminary injunction against implementation of the interim final rule. However, it is unclear whether the Biden administration will work to reverse these measures or pursue similar policy initiatives. At the state level, legislatures have increasingly passed legislation and implemented regulations designed to control pharmaceutical and biological product pricing, including price or patient reimbursement constraints, discounts, restrictions on certain product access and marketing cost disclosure and transparency measures, and, in some cases, designed to encourage importation from other countries and bulk purchasing. We expect that additional U.S. healthcare reform measures will be adopted in the future, any of which could limit the amounts that the U.S. federal government will pay for healthcare products and services, which could result in reduced demand for any future products or additional pricing pressures.

Roxadustat is considered a Class 2 substance on the 2019 World Anti-Doping Agency Prohibited List that could limit sales and increase security and distribution costs for our partners and us.

Roxadustat is considered a Class 2 substance on the World Anti-Doping Agency Prohibited List. There are enhanced security and distribution procedures we and our collaboration partners and third-party contractors will have to take to limit the risk of loss of product in the supply chain. As a result, our distribution, manufacturing and sales costs for roxadustat, as well as for our partners, will be increased which will reduce profitability. In addition, there is a risk of reduced sales due to patient access to this drug.

Our employees may engage in misconduct or improper activities, which could result in significant liability or harm our reputation.

We are exposed to the risk of employee fraud or other misconduct, including intentional failure to:

- comply with FDA regulations or similar regulations of comparable foreign regulatory authorities;
- provide accurate information to the FDA or comparable foreign regulatory authorities;
- · comply with manufacturing standards we have established;
- comply with privacy laws protecting personal information;
- comply with federal and state healthcare fraud and abuse laws and regulations and similar laws and regulations established and enforced by comparable foreign regulatory authorities;
- comply with the FCPA and other anti-bribery laws;
- report financial information or data accurately; or
- disclose unauthorized activities to us.

Employee misconduct could also involve the improper use of information obtained in the course of clinical trials, which could result in regulatory sanctions, delays in clinical trials, or serious harm to our reputation. We have adopted a code of conduct for our directors, officers and employees, but it is not always possible to identify and deter employee misconduct. The precautions we take to detect and prevent this activity may not be effective in controlling unknown or unmanaged risks or losses or in protecting us from governmental investigations or other actions or lawsuits stemming from a failure to be in compliance with such laws or regulations. If any such actions are instituted against us, and we are not successful in defending ourselves or asserting our rights, those actions could harm our business, results of operations, financial condition and cash flows, including through the imposition of significant fines or other sanctions.

If we fail to comply with environmental, health or safety laws and regulations, we could incur fines, penalties or other costs.

We are subject to numerous environmental, health and safety laws and regulations, including those governing laboratory procedures and the handling, use, storage, treatment and disposal of hazardous materials and wastes. Our operations involve the use of hazardous and flammable materials, including chemicals and biological materials. Our operations also produce hazardous waste products. We contract with third parties for the disposal of these materials and wastes. We cannot eliminate the risk of contamination or injury from these materials. In the event of contamination or injury resulting from our use of hazardous materials, we could be held liable for any resulting damages, and any liability could exceed our resources. We also could incur significant costs associated with civil or criminal fines and penalties for failure to comply with such laws and regulations. We do not maintain insurance for environmental liability or toxic tort claims that may be asserted against us in connection with our storage or disposal of biological, hazardous or radioactive materials.

In addition, we may incur substantial costs in order to comply with current or future environmental, health and safety laws and regulations applicable to our operations in the U.S. and foreign countries. These current or future laws and regulations may impair our research, development or manufacturing efforts. Our failure to comply with these laws and regulations also may result in substantial fines, penalties or other sanctions.

Risks Related to Our International Operations

We have established operations in China and are seeking approval to commercialize our product candidates outside of the U.S., and a number of risks associated with international operations could materially and adversely affect our business.

We expect to be subject to a number of risks related with our international operations, many of which may be beyond our control. These risks include:

- different regulatory requirements for drug approvals in different countries;
- different standards of care in various countries that could complicate the evaluation of our product candidates;
- different U.S. and foreign drug import and export rules;
- reduced protection for intellectual property rights in certain countries;
- · changes in tariffs, trade barriers and regulatory requirements;
- different reimbursement systems and different competitive drugs indicated to treat the indications for which our product candidates are being developed;
- economic weakness, including inflation, or political instability in particular foreign economies and markets;
- compliance with tax, employment, immigration and labor laws for employees living or traveling abroad;
- compliance with the FCPA, and other anti-corruption and anti-bribery laws;
- U.S. and foreign taxes, including income, excise, customs, consumption, withholding, and payroll taxes;
- foreign currency fluctuations, which could result in increased operating costs and expenses and reduced revenues, and other obligations incident to doing business in another country;
- workforce uncertainty in countries where labor unrest is more common than in the U.S.;
- production shortages resulting from any events affecting raw material supply or manufacturing capabilities abroad;

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 655 of 1730

- a reliance on CROs, clinical trial sites, principal investigators and other third parties that may be less experienced with clinical trials or have different methods of performing such clinical trials than we are used to in the U.S.;
- potential liability resulting from development work conducted by foreign distributors; and
- business interruptions resulting from geopolitical actions specific to an international region, including war and terrorism, or natural disasters, including the differing impact of the COVID-19 pandemic on each region.

The pharmaceutical industry in China is highly regulated and such regulations are subject to change.

The pharmaceutical industry in China is subject to comprehensive government regulation and supervision, encompassing the approval, registration, manufacturing, packaging, licensing and marketing of new drugs. In recent years, many aspects of pharmaceutical industry regulation have undergone significant reform, and reform may continue. For example, the Chinese government implemented regulations that impact distribution of pharmaceutical products in China, where at most two invoices may be issued throughout the distribution chain, a change that required us to change our distribution paradigm. Any regulatory changes or amendments may result in increased compliance costs to our business or cause delays in or prevent the successful development or commercialization of our product candidates in China. Any failure by us or our partners to maintain compliance with applicable laws and regulations or obtain and maintain required licenses and permits may result in the suspension or termination of our business activities in China.

We have limited experience distributing drugs in China.

We have established a jointly owned entity with AstraZeneca in China, one that has a distribution license. It is subject to a new body of regulations pertaining to distribution with which we have limited experience. This new distribution structure may impose higher costs or limit or delay our ability to sell products to our principal customers, and may limit the near term sales of our products. There are operational risks associated with the jointly owned entity, such as working capital funding requirements and regulatory challenges, which could impact our ability to operate in China, including increasing sales of roxadustat. We have limited experience managing distribution of pharmaceutical products, and this new distribution structure may impose higher costs or limit or delay our ability to sell products to our principal customers, and may limit the near term sales of our products.

We use our own manufacturing facilities in China to produce roxadustat API and drug product. There are risks inherent to operating commercial manufacturing facilities, and with these being our single source suppliers, we may not be able to continually meet market demand.

We have two manufacturing facilities in China, with one located in Beijing and the other in Cangzhou, Hebei.

We will be obligated to comply with continuing cGMP requirements and there can be no assurance that we will maintain all of the appropriate licenses required to manufacture our product candidates for clinical and commercial use in China. In addition, we and our product suppliers must continually spend time, money and effort in production, record-keeping and quality assurance and appropriate controls in order to ensure that any products manufactured in our facilities meet applicable specifications and other requirements for product safety, efficacy and quality and there can be no assurance that our efforts will continue to be successful in meeting these requirements.

Manufacturing facilities in China are subject to periodic unannounced inspections by the NMPA and other regulatory authorities. We expect to depend on these facilities for our product candidates and business operations in China, and we do not yet have a secondary source supplier for either roxadustat API or drug product in China. Natural disasters or other unanticipated catastrophic events, including power interruptions, water shortages, storms, fires, pandemics (including the COVID-19 pandemic), earthquakes, terrorist attacks, government appropriation of our facilities, and wars, could significantly impair our ability to operate our manufacturing facilities. Certain equipment, records and other materials located in these facilities would be difficult to replace or would require substantial replacement lead-time that would impact our ability to successfully commercialize our product candidates in China. The occurrence of any such event could materially and adversely affect our business, financial condition, results of operations, cash flows and prospects.

As a company, we have limited experience in pharmacovigilance, medical affairs, and management of the third-party distribution logistics, and cannot assure you we will be able to meet regulatory requirements or operate in these capacities successfully.

We are responsible for commercial manufacturing, pharmacovigilance, medical affairs, and management of the third-party distribution logistics (with AstraZeneca through a jointly owned entity that will perform roxadustat distribution) for roxadustat commercial activities in China. While we have been increasing our staffing in these areas, as a company, we have no experience managing or operating these functions for a commercial product and there can be no guarantee that we will do so efficiently or effectively. Mistakes or delays in these areas could limit our ability to successfully commercialize roxadustat in China, could limit our eventual market penetration, sales and profitability, and could subject us to significant liability in China.

We and our collaboration partner in China, AstraZeneca, may experience difficulties in successfully growing and sustaining sales of roxadustat in China.

We and AstraZeneca have a profit sharing arrangement with respect to roxadustat in China and any difficulties we may experience in growing and sustaining sales will affect our bottom line. Difficulties may be related to our ability to maintain reasonable pricing and reimbursement, obtain hospital listing, or other difficulties related to distribution, marketing, and sales efforts in China. For example, our current National Reimbursement Drug List reimbursement pricing is effective for a standard two-year period (between January 1, 2020 to December 31, 2021), after which time we will have to renegotiate a new price for roxadustat, which we expect to be lower based upon historical precedents. Sales of roxadustat in China may ultimately be limited due to the complex nature of the healthcare system, low average personal income, pricing controls, still developing infrastructure and potentially rapid competition from other products.

The retail prices of any product candidates that we develop may be subject to pricing control in China and elsewhere.

The price for pharmaceutical products is highly regulated in China, both at the national and provincial level. Price controls may reduce prices to levels significantly below those that would prevail in less regulated markets or limit the volume of products that may be sold, either of which may have a material and adverse effect on potential revenues from sales of roxadustat in China. Moreover, the process and timing for the implementation of price restrictions is unpredictable, which may cause potential revenues from the sales of roxadustat to fluctuate from period to period.

FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") would be subject to restrictions on paying dividends or making other payments to us, which may restrict our ability to satisfy our liquidity requirements.

We plan to conduct all of our business in China through FibroGen China Anemia Holdings, Ltd. and FibroGen Beijing. We may rely on dividends and royalties paid by FibroGen Beijing for a portion of our cash needs, including the funds necessary to service any debt we may incur and to pay our operating costs and expenses. The payment of dividends by FibroGen Beijing is subject to limitations. Regulations in China currently permit payment of dividends only out of accumulated profits as determined in accordance with accounting standards and regulations in China. FibroGen Beijing is not permitted to distribute any profits until losses from prior fiscal years have been recouped and in any event must maintain certain minimum capital requirements. FibroGen Beijing is also required to set aside at least 10.0% of its after-tax profit based on Chinese accounting standards each year to its statutory reserve fund until the cumulative amount of such reserves reaches 50.0% of its registered capital. Statutory reserves are not distributable as cash dividends. In addition, if FibroGen Beijing incurs debt on its own behalf in the future, the agreements governing such debt may restrict its ability to pay dividends or make other distributions to us. As of December 31, 2020, approximately \$44.6 million of our cash and cash equivalents is held in China.

Any capital contributions from us to FibroGen Beijing must be approved by the Ministry of Commerce in China, and failure to obtain such approval may materially and adversely affect the liquidity position of FibroGen Beijing.

The Ministry of Commerce in China or its local counterpart must approve the amount and use of any capital contributions from us to FibroGen Beijing, and there can be no assurance that we will be able to complete the necessary government registrations and obtain the necessary government approvals on a timely basis, or at all. If we fail to do so, we may not be able to contribute additional capital to fund our Chinese operations, and the liquidity and financial position of FibroGen Beijing may be materially and adversely affected.

We may be subject to currency exchange rate fluctuations and currency exchange restrictions with respect to our operations in China, which could adversely affect our financial performance.

Most of our product sales will occur in local Chinese currency and our operating results will be subject to volatility from currency exchange rate fluctuations. To date, we have not hedged against the risks associated with fluctuations in exchange rates and, therefore, exchange rate fluctuations could have an adverse impact on our future operating results. Changes in value of the Renminbi against the U.S. dollar, Euro and other currencies is affected by, among other things, changes in China's political and economic conditions. Currently, the Renminbi is permitted to fluctuate within a narrow and managed band against a basket of certain foreign currencies. Any significant currency exchange rate fluctuations may have a material adverse effect on our business and financial condition.

In addition, the Chinese government imposes controls on the convertibility of the Renminbi into foreign currencies and the remittance of foreign currency out of China for certain transactions. Shortages in the availability of foreign currency may restrict the ability of FibroGen Beijing to remit sufficient foreign currency to pay dividends or other payments to us, or otherwise satisfy their foreign currency-denominated obligations. Under existing Chinese foreign exchange regulations, payments of current account items, including profit distributions, interest payments and balance of trade, can be made in foreign currencies without prior approval from the State Administration of Foreign Exchange by complying with certain procedural requirements. However, approval from State Administration of Foreign Exchange or its local branch is required where Renminbi is to be converted into foreign currency and remitted out of China to pay capital expenses such as the repayment of loans denominated in foreign currencies. The Chinese government may also at its discretion restrict access in the future to foreign currencies for current account transactions. If the foreign exchange control system prevents us from obtaining sufficient foreign currency to satisfy our operational requirements, our liquidity and financial position may be materially and adversely affected.

Because FibroGen Beijing's funds are held in banks that do not provide insurance, the failure of any bank in which FibroGen Beijing deposits its funds could adversely affect our business.

Banks and other financial institutions in China do not provide insurance for funds held on deposit. As a result, in the event of a bank failure, FibroGen Beijing may not have access to funds on deposit. Depending upon the amount of money FibroGen Beijing maintains in a bank that fails, its inability to have access to cash could materially impair its operations.

We may be subject to tax inefficiencies associated with our offshore corporate structure.

The tax regulations of the U.S. and other jurisdictions in which we operate are extremely complex and subject to change. New laws, new interpretations of existing laws, such as the Base Erosion Profit Shifting project initiated by the Organization for Economic Co-operation and Development, and any legislation proposed by the relevant taxing authorities, or limitations on our ability to structure our operations and intercompany transactions may lead to inefficient tax treatment of our revenue, profits, royalties, and distributions, if any are achieved.

In addition, our foreign subsidiaries and we have various intercompany transactions. We may not be able to obtain certain benefits under relevant tax treaties to avoid double taxation on certain transactions among our subsidiaries. If we are not able to avail ourselves to the tax treaties, we could be subject to additional taxes, which could adversely affect our financial condition and results of operations.

On December 22, 2017, the Tax Cuts and Jobs Act (Tax Act) was enacted which instituted various changes to the taxation of multinational corporations. Since inception, various regulations and interpretations have been issued by governing authorities and we continue to examine the impacts to our business, which could potentially have a material adverse effect on our business, results of operations or financial conditions.

Our foreign operations, particularly those in China, are subject to significant risks involving the protection of intellectual property.

We seek to protect the products and technology that we consider important to our business by pursuing patent applications in China and other countries, relying on trade secrets or pharmaceutical regulatory protection or employing a combination of these methods. We note that the filing of a patent application does not mean that we will be granted a patent, or that any patent eventually granted will be as broad as requested in the patent application or will be sufficient to protect our technology. There are a number of factors that could cause our patents, if granted, to become invalid or unenforceable or that could cause our patent applications not to be granted, including known or unknown prior art, deficiencies in the patent application, or lack of originality of the technology. Furthermore, the terms of our patents are limited. The patents we hold and the patents that may be granted from our currently pending patent applications have, absent any patent term adjustment or extension, a twenty-year protection period starting from the date of application.

Intellectual property rights and confidentiality protections in China may not be as effective as those in the U.S. or other countries for many reasons, including lack of procedural rules for discovery and evidence, low damage awards, and lack of judicial independence. Implementation and enforcement of China intellectual property laws have historically been deficient and ineffective and may be hampered by corruption and local protectionism. Policing unauthorized use of proprietary technology is difficult and expensive, and we may need to resort to litigation to enforce or defend patents issued to us or to determine the enforceability and validity of our proprietary rights or those of others. The experience and capabilities of China courts in handling intellectual property litigation varies and outcomes are unpredictable. An adverse determination in any such litigation could materially impair our intellectual property rights and may harm our business.

Uncertainties with respect to the China legal system could have a material adverse effect on us.

The legal system of China is a civil law system primarily based on written statutes. Unlike in a common law system, prior court decisions may be cited for reference but are not binding. Because the China legal system continues to rapidly evolve, the interpretations of many laws, regulations and rules are not always uniform and enforcement of these laws, regulations and rules involve uncertainties, which may limit legal protections available to us. Moreover, decision makers in the China judicial system have significant discretion in interpreting and implementing statutory and contractual terms, which may render it difficult for FibroGen Beijing to enforce the contracts it has entered into with our business partners, customers and suppliers. Different government departments may have different interpretations of certain laws and regulations, and licenses and permits issued or granted by one government authority may be revoked by a higher government authority at a later time. Navigating the uncertainty and change in the China legal system will require the devotion of significant resources and time, and there can be no assurance that our contractual and other rights will ultimately be enforced.

Changes in China's economic, governmental, or social conditions could have a material adverse effect on our business.

Chinese society and the Chinese economy continue to undergo significant change. Changes in the regulatory structure, regulations, and economic policies of the Chinese government could have a material adverse effect on the overall economic growth of China, which could adversely affect our ability to conduct business in China. The Chinese government continues to adjust economic policies to promote economic growth. Some of these measures benefit the overall Chinese economy, but may also have a negative effect on us. For example, our financial condition and results of operations in China may be adversely affected by government control over capital investments or changes in tax regulations. As the Chinese pharmaceutical industry grows and evolves, the Chinese government may also implement measures to change the regulatory structure and structure of foreign investment in this industry. We are unable to predict the frequency and scope of such policy changes and structural changes, any of which could materially and adversely affect FibroGen Beijing's development and commercialization timelines, liquidity, access to capital, and its ability to conduct business in China. Any failure on our part to comply with changing government regulations and policies could result in the loss of our ability to develop and commercialize our product candidates in China. In addition, the changing government regulations and policies could result in delays and cost increases to our development, manufacturing, approval, and commercialization timelines in China.

Our operations in China subject us to various Chinese labor and social insurance laws, and our failure to comply with such laws may materially and adversely affect our business, financial condition and results of operations.

We are subject to China Labor Contract Law, which provides strong protections for employees and imposes many obligations on employers. The Labor Contract Law places certain restrictions on the circumstances under which employers may terminate labor contracts and require economic compensation to employees upon termination of employment, among other things. In addition, companies operating in China are generally required to contribute to labor union funds and the mandatory social insurance and housing funds. Any failure by us to comply with Chinese labor and social insurance laws may subject us to late fees, fines and penalties, or cause the suspension or termination of our ability to conduct business in China, any of which could have a material and adverse effect on business, results of operations and prospects.

Risks Related to the Operation of Our Business

We have incurred significant losses since our inception and anticipate that we will continue to incur losses for the foreseeable future and may never achieve or sustain profitability. We may require additional financings in order to fund our operations.

We are a biopharmaceutical company with two lead product candidates in clinical development, roxadustat for anemia in CKD, myelodysplastic syndromes, and chemotherapy-induced anemia, and pamrevlumab for IPF, pancreatic cancer, and DMD. Most of our revenue generated to date has been based on our collaboration agreements and we have limited commercial drug product sales to date. We continue to incur significant research and development and other expenses related to our ongoing operations. Our net loss for the year ended December 31, 2020, 2019 and 2018 were \$189.3 million, \$77.0 million and \$86.4 million, respectively. As of December 31, 2020, we had an accumulated deficit of \$974.0 million. As of December 31, 2020, we had capital resources consisting of cash, cash equivalents and short-term investments of \$686.5 million plus \$0.2 million of long-term investments classified as available for sale securities. Despite contractual development and cost coverage commitments from our collaboration partners, AstraZeneca and Astellas, and the potential to receive milestone and other payments from these partners, and despite commercialization efforts in the China and Japan for roxadustat for the treatment of anemia caused by CKD, we anticipate we will continue to incur losses on an annual basis for the foreseeable future. If we do not successfully develop and continue to obtain regulatory approval for our existing or any future product candidates and effectively manufacture, market and sell the product candidates that are approved, we may never achieve or sustain profitability on a quarterly or annual basis. Our prior losses, combined with expected future losses, have had and will continue to have an adverse effect on our stockholders' equity and working capital. Our failure to become and remain profitable would depress the market price of our common stock and could impair our ability to raise capital, expand our business, diversify our product offerings or continue our operations.

We believe that we will continue to expend substantial resources for the foreseeable future as we continue late-stage clinical development of roxadustat, grow our operations in China, expand our clinical development efforts on pamrevlumab, continue to seek regulatory approval, establish commercialization capabilities of our product candidates, and pursue additional indications. These expenditures will include costs associated with research and development, conducting preclinical trials and clinical trials, obtaining regulatory approvals in various jurisdictions, and manufacturing and supplying products and product candidates for ourselves and our partners. The outcome of any clinical trial and/or regulatory approval process is highly uncertain and we are unable to fully estimate the actual costs necessary to successfully complete the development and regulatory approval process for our compounds in development and any future product candidates. We believe that the net proceeds from our 2017 public offerings, our existing cash and cash equivalents, short-term and long-term investments and accounts receivable, and expected third-party collaboration revenues will allow us to fund our operating plans through at least the next 12 months. Our operating plans or third-party collaborations may change as a result of many factors, including the success of our development and commercialization efforts, operations costs (including manufacturing and regulatory), competition, and other factors that may not currently be known to us, and we therefore may need to seek additional funds sooner than planned, through offerings of public or private securities, debt financings or other sources, such as royalty monetization or other structured financings. Such financings may result in dilution to stockholders, imposition of debt covenants and repayment obligations, or other restrictions that may adversely affect our business. We may also seek additional capital due to favorable market conditions or strategic considerations even if we c

Additional funds may not be available when we require them, or on terms that are acceptable to us. If adequate funds are not available to us on a timely basis, we may be required to delay, limit, reduce or terminate our research and development efforts or other operations or activities that may be necessary to commercialize our product candidates.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 660 of 1730

Most of our recent revenue has been earned from collaboration partners for our product candidates under development.

If either or both of our Astellas and AstraZeneca collaborations were to be terminated, we could require significant additional capital in order to proceed with development and commercialization of our product candidates, including with respect to our commercialization of roxadustat for the treatment of anemia caused by CKD, or we may require additional partnering in order to help fund such development and commercialization. If adequate funds or partners are not available to us on a timely basis or on favorable terms, we may be required to delay, limit, reduce or terminate our development or commercialization efforts or other operations.

We may encounter difficulties in managing our growth and expanding our operations successfully.

As we seek to advance our product candidates through clinical trials and commercialization, we will need to expand our development, regulatory, manufacturing, commercialization and administration capabilities or contract with third parties to provide these capabilities for us. As our operations expand and we continue to undertake the efforts and expense to operate as a public reporting company, we expect that we will need to increase the responsibilities on members of management in order to manage any future growth effectively. Our failure to accomplish any of these steps could prevent us from successfully implementing our strategy and maintaining the confidence of investors in us.

Loss of senior management and key personnel could adversely affect our business.

We are highly dependent on members of our senior management team, including Enrique Conterno, our Chief Executive Officer. The loss of the services of Mr. Conterno or any of our senior management could significantly impact the development and commercialization of our products and product candidates and our ability to successfully implement our business strategy.

Recruiting and retaining qualified commercial, development, scientific, clinical, and manufacturing personnel are and will continue to be critical to our success, particularly as we expand our commercialization operations. Furthermore, replacing executive officers and key employees may be difficult and may take an extended period of time because of the limited number of individuals in our industry with the breadth of skills and experience required to successfully develop, gain regulatory approval of and commercialize product candidates. We may be unable to hire, train, retain or motivate these key personnel on acceptable terms given the intense competition among numerous biopharmaceutical companies for similar personnel.

There is also significant competition, in particular in the San Francisco Bay Area, for the hiring of experienced and qualified personnel, which increases the importance of retention of our existing personnel. If we are unable to continue to attract and retain personnel with the quality and experience applicable to our product candidates, our ability to pursue our strategy will be limited and our business and operations would be adversely affected.

If product liability lawsuits are brought against us, we may incur substantial liabilities and may have to limit commercial operations.

We face an inherent risk of product liability as a result of the clinical testing, manufacturing and commercialization of our product candidates. Any such product liability claims may include allegations of defects in manufacturing, defects in design, a failure to warn of dangers inherent in a product, negligence, strict liability or breach of warranty. Claims could also be asserted under state consumer protection acts. If we are unable to obtain insurance coverage at levels that are appropriate to maintain our business and operations, or if we are unable to successfully defend ourselves against product liability claims, we may incur substantial liabilities or otherwise cease operations. Product liability claims may result in:

- · termination of further development of unapproved product candidates or significantly reduced demand for any approved products;
- material costs and expenses to defend the related litigation;
- a diversion of time and resources across the entire organization, including our executive management;
- product recalls, withdrawals or labeling restrictions;
- termination of our collaboration relationships or disputes with our collaboration partners; and
- reputational damage negatively impacting our other product candidates in development.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 661 of 1730

If we fail to obtain and retain sufficient product liability insurance at an acceptable cost to protect against potential product liability claims, we may not be able to continue to develop our product candidates. We maintain product liability insurance in a customary amount for the stage of development of our product candidates. Although we believe that we have sufficient coverage based on the advice of our third-party advisors, there can be no assurance that such levels will be sufficient for our needs. Moreover, our insurance policies have various exclusions, and we may be in a dispute with our carrier as to the extent and nature of our coverage, including whether we are covered under the applicable product liability policy. If we are not able to ensure coverage or are required to pay substantial amounts to settle or otherwise contest the claims for product liability, our business and operations would be negatively affected.

Our business and operations would suffer in the event of computer system failures.

Despite the implementation of security measures, our internal computer systems, and those of our CROs, collaboration partners, and other third parties on which we rely, are vulnerable to damage from computer viruses, unauthorized access, natural disasters, fire, terrorism, war and telecommunication and electrical failures. We upgraded our disaster and data recovery capabilities in 2019, and have continued to upgrade these capabilities. However, to the extent that any disruption or security breach, in particular with our partners' operations, results in a loss of, or damage to, our data or applications, or inappropriate disclosure of confidential or proprietary information, we could incur liability and it could result in a material disruption and delay of our drug development programs. For example, the loss of clinical trial data from completed, ongoing or planned clinical trials could result in delays in our regulatory approval efforts and significantly increase our costs to recover or reproduce the data.

We depend on sophisticated information technology systems and could face a cyber-attack or other breach of these systems.

We rely on information technology systems to process, transmit and store electronic information in our day-to-day operations. The size and complexity of our information technology systems makes them vulnerable to a cyber-attack, malicious intrusion, breakdown, destruction, loss of data privacy or other significant disruption. While we upgraded our disaster data recovery program in March 2019, a successful attack could result in the theft or destruction of intellectual property, data, or other misappropriation of assets, or otherwise compromise our confidential or proprietary information and disrupt our operations. Cyber-attacks are becoming more sophisticated and frequent. We have invested in our systems and the protection and recoverability of our data to reduce the risk of an intrusion or interruption, and we monitor and test our systems on an ongoing basis for any current or potential threats. There can be no assurance that these measures and efforts will prevent future interruptions or breakdowns. If we fail to maintain or protect our information technology systems and data integrity effectively or fail to anticipate, plan for or manage significant disruptions to these systems, we could have difficulty preventing, detecting and controlling such cyber-attacks and any such attacks could result in losses described above as well as disputes with physicians, patients and our partners, regulatory sanctions or penalties, increases in operating costs and expenses, expenses or lost revenues or other adverse consequences, any of which could have a material adverse effect on our business, results of operations, financial condition, prospects and cash flows.

Our headquarters are located near known earthquake fault zones.

We and some of the third-party service providers on which we depend for various support functions are vulnerable to damage from catastrophic events, such as power loss, natural disasters, terrorism and similar unforeseen events beyond our control. Our corporate headquarters and other facilities are located in the San Francisco Bay Area, which in the past has experienced severe earthquakes and fires, and has been affected by the COVID-19 pandemic, including economic disruption resulting from the related shelter-in-place and stay-at-home governmental orders.

After a comprehensive earthquake risk analysis conducted by Marsh Risk, we decided not to purchase earthquake or flood insurance. Based upon (among other factors) the Marsh Risk analysis, the design and construction of our building, the expected potential loss, and the costs and deductible associated with earthquake and flood insurance, we chose to self-insure. However, earthquakes or other natural disasters could severely disrupt our operations, or have a larger cost than expected, and have a material adverse effect on our business, results of operations, financial condition and prospects.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 662 of 1730

If a natural disaster, power outage or other event occurred that prevented us from using all or a significant portion of our headquarters, damaged critical infrastructure, or otherwise disrupted operations, it may be difficult or, in certain cases, impossible for us to continue our business for a substantial period of time. The disaster recovery and business continuity plans we have in place are unlikely to provide adequate protection in the event of a serious disaster or similar event. We may incur substantial expenses as a result of the limited nature of our disaster recovery and business continuity plans, which, particularly when taken together with our lack of earthquake insurance, could have a material adverse effect on our business.

Furthermore, integral parties in our supply chain are operating from single sites, increasing their vulnerability to natural disasters or other sudden, unforeseen and severe adverse events, such as the COVID-19 pandemic. If such an event were to affect our supply chain, it could have a material adverse effect on our business.

Risks Related to Our Common Stock

The market price of our common stock may be highly volatile, and you may not be able to resell your shares at or above your purchase price.

In general, pharmaceutical, biotechnology and other life sciences company stocks have been highly volatile in the current market. The volatility of pharmaceutical, biotechnology and other life sciences company stocks is sometimes unrelated to the operating performance of particular companies and biotechnology and life science companies stocks often respond to trends and perceptions rather than financial performance. In particular, the market price of shares of our common stock could be subject to wide fluctuations in response to the following factors:

- results of clinical trials of our product candidates, including roxadustat and pamrevlumab;
- the timing of the release of results of and regulatory updates regarding our clinical trials;
- the level of expenses related to any of our product candidates or clinical development programs;
- results of clinical trials of our competitors' products;
- safety issues with respect to our product candidates or our competitors' products;
- · regulatory actions with respect to our product candidates and any approved products or our competitors' products;
- fluctuations in our financial condition and operating results, which will be significantly affected by the manner in which we recognize revenue from the achievement of milestones under our collaboration agreements;
- adverse developments concerning our collaborations and our manufacturers;
- the termination of a collaboration or the inability to establish additional collaborations;
- the inability to obtain adequate product supply for any approved drug product or inability to do so at acceptable prices;
- disputes or other developments relating to proprietary rights, including patents, litigation matters and our ability to obtain patent protection for our technologies;
- changes in legislation or other regulatory developments affecting our product candidates or our industry;
- fluctuations in the valuation of the biotechnology industry and particular companies perceived by investors to be comparable to us;
- speculation in the press or investment community;
- announcements of investigations or regulatory scrutiny of our operations or lawsuits filed against us;
- activities of the government of China, including those related to the pharmaceutical industry as well as industrial policy generally;
- performance of other U.S. publicly traded companies with significant operations in China;
- changes in market conditions for biopharmaceutical stocks; and
- the other factors described in this "Risk Factors" section.

As a result of fluctuations caused by these and other factors, comparisons of our operating results across different periods may not be accurate indicators of our future performance. Any fluctuations that we report in the future may differ from the expectations of market analysts and investors, which could cause the price of our common stock to fluctuate significantly. Moreover, securities class action litigation has often been initiated against companies following periods of volatility in their stock price. This type of litigation could result in substantial costs and divert our management's attention and resources and could also require us to make substantial payments to satisfy judgments or to settle litigation.

Our principal stockholders own a significant percentage of our stock and will be able to exercise influence over stockholder approvals.

As of January 31, 2021, our executive officers, directors and principal stockholders, together with their respective affiliates, owned approximately 41.43% of our common stock, including shares subject to outstanding options that are exercisable within 60 days after such date and shares issuable upon settlement of restricted stock units that will vest within 60 days after such date. This percentage is based upon information supplied by officers, directors and principal stockholders and Schedules 13D and 13G, if any, filed with the SEC, which information may not be accurate as of January 31, 2020. Accordingly, these stockholders will be able to exert a significant degree of influence over our management and affairs and over matters requiring stockholder approval, including the election of our board of directors and approval of significant corporate transactions. The interests of this group may differ from those of other stockholders and they may vote their shares in a way that is contrary to the way other stockholders vote their shares. This concentration of ownership could have the effect of entrenching our management and/or the board of directors, delaying or preventing a change in our control or otherwise discouraging a potential acquirer from attempting to obtain control of us, which in turn could have a material and adverse effect on the fair market value of our common stock.

We may engage in acquisitions that could dilute stockholders and harm our business.

We may, in the future, make acquisitions of or investments in companies that we believe have products or capabilities that are a strategic or commercial fit with our present or future product candidates and business or otherwise offer opportunities for us. In connection with these acquisitions or investments, we may:

- issue stock that would dilute our existing stockholders' percentage of ownership;
- incur debt and assume liabilities; and
- · incur amortization expenses related to intangible assets or incur large and immediate write-offs.

We may not be able to complete acquisitions on favorable terms, if at all. If we do complete an acquisition, we cannot assure you that it will ultimately strengthen our competitive position or that it will be viewed positively by customers, financial markets or investors. Furthermore, future acquisitions could pose numerous additional risks to our operations, including:

- problems integrating the purchased business, products or technologies, or employees or other assets of the acquisition target;
- increases to our expenses;
- disclosed or undisclosed liabilities of the acquired asset or company;
- diversion of management's attention from their day-to-day responsibilities;
- · reprioritization of our development programs and even cessation of development and commercialization of our current product candidates;
- · harm to our operating results or financial condition;
- entrance into markets in which we have limited or no prior experience; and
- potential loss of key employees, particularly those of the acquired entity.

We may not be able to complete any acquisitions or effectively integrate the operations, products or personnel gained through any such acquisition.

Provisions in our charter documents and Delaware law may have anti-takeover effects that could discourage an acquisition of us by others, and may prevent attempts by our stockholders to replace or remove our current directors or management.

Provisions in our amended and restated certificate of incorporation and amended and restated bylaws contain provisions that may have the effect of discouraging, delaying or preventing a change in control of us or changes in our management. These provisions could also limit the price that investors might be willing to pay in the future for shares of our common stock, thereby depressing the market price of our common stock. In addition, because our board of directors is responsible for appointing the members of our management team, these provisions may frustrate or prevent any attempts by our stockholders to replace or remove our current management by making it more difficult for stockholders to replace members of our board of directors. Among other things, these provisions:

- authorize "blank check" preferred stock, which could be issued by our board of directors without stockholder approval and may contain voting, liquidation, dividend and other rights superior to our common stock;
- create a classified board of directors whose members serve staggered three-year terms;
- specify that special meetings of our stockholders can be called only by our board of directors pursuant to a resolution adopted by a majority of the total number of directors;
- prohibit stockholder action by written consent;
- establish an advance notice procedure for stockholder approvals to be brought before an annual meeting of our stockholders, including proposed nominations of persons for election to our board of directors;
- provide that our directors may be removed prior to the end of their term only for cause;
- · provide that vacancies on our board of directors may be filled only by a majority of directors then in office, even though less than a quorum;
- · require a supermajority vote of the holders of our common stock or the majority vote of our board of directors to amend our bylaws; and
- require a supermajority vote of the holders of our common stock to amend the classification of our board of directors into three classes and to amend certain other provisions of our certificate of incorporation.

These provisions, alone or together, could delay or prevent hostile takeovers and changes in control or changes in our management by making it more difficult for stockholders to replace members of our board of directors, which is responsible for appointing the members of our management.

Moreover, because we are incorporated in Delaware, we are governed by certain anti-takeover provisions under Delaware law which may discourage, delay or prevent someone from acquiring us or merging with us whether or not it is desired by or beneficial to our stockholders. We are subject to the provisions of Section 203 of the Delaware General Corporation Law, which prohibits a person who owns in excess of 15% of our outstanding voting stock from merging or combining with us for a period of three years after the date of the transaction in which the person acquired in excess of 15% of our outstanding voting stock, unless the merger or combination is approved in a prescribed manner.

Any provision of our amended and restated certificate of incorporation, our amended and restated bylaws or Delaware law that has the effect of delaying or deterring a change in control could limit the opportunity for our stockholders to receive a premium for their shares of our common stock, and could also affect the price that some investors are willing to pay for our common stock.

Changes in our tax provision or exposure to additional tax liabilities could adversely affect our earnings and financial condition.

As a multinational corporation, we are subject to income taxes in the U.S. and various foreign jurisdictions. Significant judgment is required in determining our global provision for income taxes and other tax liabilities. In the ordinary course of a global business, there are intercompany transactions and calculations where the ultimate tax determination is uncertain. Our income tax returns are subject to audits by tax authorities. Although we regularly assess the likelihood of adverse outcomes resulting from these examinations to determine our tax estimates, a final determination of tax audits or tax disputes could have an adverse effect on our results of operations and financial condition.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 665 of 1730

We are also subject to non-income taxes, such as payroll, excise, customs and duties, sales, use, value-added, net worth, property, gross receipts, and goods and services taxes in the U.S., state and local, and various foreign jurisdictions. We are subject to audit and assessments by tax authorities with respect to these non-income taxes and may have exposure to additional non-income tax liabilities, which could have an adverse effect on our results of operations and financial condition.

Federal and state tax laws impose substantial restrictions on the utilization of net operating loss and credit carryforwards in the event of an "ownership change" for tax purposes, as defined in IRC Section 382. If additional ownership change occurs, the utilization of net operating loss and credit carryforwards could be significantly reduced.

In addition, our judgment in providing for the possible impact of the Tax Act remains subject to developing interpretations of the provisions of the Tax Act. As regulations and guidance evolve with respect to the Tax Act, we continue to examine the impact to our tax provision or exposure to additional tax liabilities, which could have a material adverse effect on our business, results of operations or financial condition.

Tariffs imposed by the U.S. and those imposed in response by other countries could have a material adverse effect on our business.

Changes in U.S. and foreign governments' trade policies have resulted in, and may continue to result in, tariffs on imports into and exports from the U.S. Throughout 2018 and 2019, the U.S. imposed tariffs on imports from several countries, including China. In response, China has proposed and implemented their own tariffs on certain products, which may impact our supply chain and our costs of doing business. If we are impacted by the changing trade relations between the U.S. and China, our business and results of operations may be negatively impacted. Continued diminished trade relations between the U.S. and other countries, including potential reductions in trade with China and others, as well as the continued escalation of tariffs, could have a material adverse effect on our financial performance and results of operations.

Our certificate of incorporation designates courts located in Delaware as the sole forum for certain proceedings, which could limit our stockholders' ability to obtain a favorable judicial forum for disputes with us or our directors, officers or employees.

Our amended and restated certificate of incorporation provides that, subject to limited exceptions, the state and federal courts located in the State of Delaware will be the sole and exclusive forum for the following types of actions or proceedings under Delaware statutory or common law: (1) any derivative action or proceeding brought on our behalf, (2) any action asserting a claim of breach of a fiduciary duty owed by any of our directors, officers or other employees to us or our stockholders, (3) any action asserting a claim against us arising pursuant to any provision of the Delaware General Corporation Law, our amended and restated certificate of incorporation or our amended and restated by-laws, or (4) any other action asserting a claim against us that is governed by the internal affairs doctrine. This provision would not apply to suits brought to enforce a duty or liability created by the Exchange Act. Furthermore, Section 22 of the Securities Act creates concurrent jurisdiction for federal and state courts over all such Securities Act actions. Accordingly, both state and federal courts have jurisdiction to entertain such claims. To prevent having to litigate claims in multiple jurisdictions and the threat of inconsistent or contrary rulings by different courts, among other considerations, our amended and restated certificate of incorporation further provides that the U.S. federal district courts will be the exclusive forum for resolving any complaint asserting a cause of action arising under the Securities Act. While the Delaware courts have determined that such choice of forum provisions are facially valid, a stockholder may nevertheless seek to bring a claim in a venue other than those designated in the exclusive forum provisions. In such instance, we would expect to vigorously assert the validity and enforceability of the exclusive forum provisions of our amended and restated certificate of incorporation. This may require significant additional costs associated with resolving such action in other juri

This choice of forum provision may limit a stockholder's ability to bring a claim in a judicial forum that it finds favorable for disputes with us or our directors, officers or other employees, which may discourage such lawsuits against us and our directors, officers and employees. If a court were to find these provisions of our amended and restated certificate of incorporation inapplicable to, or unenforceable in respect of, one or more of the specified types of actions or proceedings, we may incur additional costs associated with resolving such matters in other jurisdictions, which could adversely affect our business and financial condition.

We do not plan to pay dividends. Capital appreciation will be your sole possible source of gain, which may never occur.

You should not rely on an investment in our common stock to provide dividend income. We do not anticipate that we will pay any cash dividends to holders of our common stock in the foreseeable future and investors seeking cash dividends should not purchase our common stock. We plan to retain any earnings to invest in our product candidates and maintain and expand our operations. Therefore, capital appreciation, or an increase in your stock price, which may never occur, may be the only way to realize any return on your investment.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 666 of 1730

ITEM 1B. UNRESOLVED STAFF COMMENTS

None.

ITEM 2. PROPERTIES

Our corporate and research and development operations are located in San Francisco, California, where we lease approximately 234,000 square feet of office and laboratory space with approximately 35,000 square feet subleased. The lease for our San Francisco headquarters expires in 2023. We also lease approximately 67,000 square feet of office and manufacturing space in Beijing, China, and multiple office spaces in Beijing and Shanghai, China. Our leases in China expire in 2023. We have constructed a commercial manufacturing facility of approximately 5,500 square meters in Cangzhou, China, on approximately 33,000 square meters of land. Our right to use such land expires in 2068. We believe our facilities are adequate for our current needs and that suitable additional or substitute space would be available if needed.

ITEM 3. LEGAL PROCEEEDINGS

We are a party to various legal actions that arose in the ordinary course of our business. We recognize accruals for any legal action when we conclude that a loss is probable and reasonably estimable. We did not have any material accruals for any currently active legal action in our consolidated balance sheets as of December 31, 2020, as we could not predict the ultimate outcome of these matters, or reasonably estimate the potential exposure.

On April 20, 2020, in response to an invalidation action brought against certain FibroGen United Kingdom patents by Akebia, the United Kingdom court handed down a decision invalidating United Kingdom designations of European Patent Nos. 1463823, 1633333, 2298301, 2322153, and 2322155. The United Kingdom designation to European Patent No. 2289531 was held to be valid in amended form, but not infringed by Akebia. We and our partner Astellas have filed an appeal of the decision in the United Kingdom Court of Appeal.

ITEM 4. MINE SAFETY DISCLOSURES

Not applicable.

PART II

ITEM 5. MARKET FOR REGISTRANT'S COMMON EQUITY, RELATED STOCKHOLDER MATTERS AND ISSUER PURCHASES OF EQUITY SECURITIES

Market Information for Common Stock

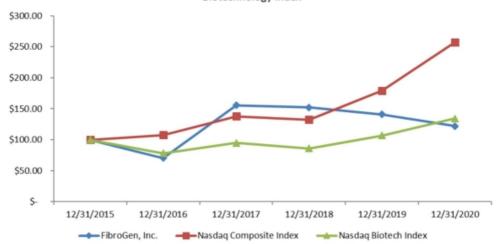

Our common stock has been listed on the NASDAQ Global Select Market ("NASDAQ") since November 14, 2014, under the symbol "FGEN." Prior to our initial public offering, there was no public market for our common stock.

Stock Price Performance Graph

The following graph illustrates a comparison of the total cumulative stockholder return for our common stock since December 31, 2015 to two indices: the NASDAQ Composite Index and the NASDAQ Biotechnology Index. The graph assumes an initial investment of \$100 on December 31, 2015, in our common stock, the stocks comprising the NASDAQ Composite Index, and the stocks comprising the NASDAQ Biotechnology Index. The stockholder return shown in the graph below is not necessarily indicative of future performance, and we do not make or endorse any predictions as to future stockholder returns.

COMPARISON OF 5 YEAR CUMULATIVE TOTAL RETURN

Among FibroGen, Inc., the NASDAQ Composite Index and the NASDAQ Biotechnology Index

The above Stock Price Performance Graph and related information shall not be deemed "soliciting material" or to be "filed" with the Securities and Exchange Commission, nor shall such information be incorporated by reference into any future filing under the Securities Act or Exchange Act, except to the extent that we specifically incorporate it by reference into such filing.

Dividend Policy

We have never declared or paid any cash dividends on our capital stock. We currently intend to retain all available funds and any future earnings to support our operations and finance the growth and development of our business. We do not intend to pay cash dividends on our common stock for the foreseeable future. Any future determination related to our dividend policy will be made at the discretion of our board of directors and will depend on then-existing conditions, including our financial condition, operating results, contractual restrictions, capital requirements, business prospects and other factors our board of directors may deem relevant.

Stockholders

As of January 31, 2021, there were 129 registered stockholders of record for our common stock. This number of registered stockholders does not include stockholders whose shares are held in street name by brokers and other nominees, or may be held in trust by other entities. Therefore, the actual number of stockholders is greater than this number of registered stockholders of record.

Use of Proceeds from Initial Public Offering of Common Stock

On November 13, 2014, our Registration Statement on Form S-1, as amended (Reg. Nos. 333-199069 and 333-200189) was declared effective in connection with the initial public offering of our common stock. There has been no material change in the planned use of proceeds from our initial public offering as described in our final prospectus filed with the SEC pursuant to Rule 424(b) under the Securities Act on November 14, 2014.

Recent Sales of Unregistered Securities

None.

Purchases of Equity Securities by the Issuer and Affiliated Purchasers

None.

ITEM 6. SELECTED FINANCIAL DATA

We have adopted the amendment to eliminate Item 301 of Regulation S-K, and we are omitting this disclosure in reliance thereon.

ITEM 7. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

You should read the following discussion and analysis of our financial condition and results of operations together with our consolidated financial statements and related notes and other financial information included in Item 8 of this Annual Report on Form 10-K. Some of the information contained in this discussion and analysis or set forth elsewhere in this Annual Report, including information with respect to our plans and strategy for our business, international operations and product candidates, includes forward-looking statements that involve risks and uncertainties. You should review the "Risk Factors" section of this Annual Report for a discussion of important factors that could cause our actual results to differ materially from the results described in or implied by the forward-looking statements contained in the following discussion and analysis.

BUSINESS OVERVIEW

We are headquartered in San Francisco, California, with subsidiary offices in Beijing and Shanghai, People's Republic of China ("China"). We are a leading biopharmaceutical company developing and commercializing a pipeline of first-in-class therapeutics. We apply our pioneering expertise in hypoxia-inducible factor ("HIF") biology, 2-oxoglutarate enzymology, connective tissue growth factor ("CTGF") biology, and clinical development to advance innovative medicines for the treatment of anemia, fibrotic disease, and cancer.

Roxadustat, our most advanced product, is an oral small molecule inhibitor of HIF prolyl hydroxylase (together with HIF, "HIF-PH") activity that has received marketing authorization in China (tradename: 爱瑞卓®) for the treatment of anemia caused by chronic kidney disease ("CKD") in dialysis and non-dialysis patients. EVRENZO® (roxadustat) is also approved in Japan and Chile for the treatment of anemia associated with CKD in dialysis and non-dialysis patients.

Our New Drug Application ("NDA") filing in the United States ("U.S.") for roxadustat for the treatment of anemia in dialysis and non-dialysis CKD patients was submitted for review in December 2019 to the U.S. Food and Drug Administration ("FDA") and in December 2020, the FDA extended the review period of the NDA by three months for FibroGen to submit additional analyses of existing roxadustat clinical data, and set a new Prescription Drug User Fee Act ("PDUFA") goal date of March 20, 2021. On March 1, 2021, the FDA informed us that the Cardiovascular and Renal Drugs Advisory Committee will hold an advisory committee meeting to review the NDA for roxadustat. The date of the advisory committee meeting has not been set. As a result of this communication, we will not receive an approval decision by the PDUFA goal date. In Europe, the Marketing Authorization Application ("MAA") filing for roxadustat for the treatment of anemia in dialysis and non-dialysis CKD patients was accepted for regulatory review by the European Medicines Agency ("EMA") in May 2020 and Astellas Pharma Inc. ("Astellas") expects an approval decision mid-2021.

Roxadustat is in Phase 3 clinical development in the U.S. and Europe and in Phase 2/3 development in China for anemia associated with myelodysplastic syndromes. Roxadustat is in Phase 2 clinical development for chemotherapy-induced anemia.

Pamrevlumab, an anti-CTGF human monoclonal antibody, is in Phase 3 clinical development for the treatment of idiopathic pulmonary fibrosis ("IPF"), pancreatic cancer and Duchenne muscular dystrophy.

Impact of COVID-19

On March 11, 2020, COVID-19, a disease caused by a novel strain of the coronavirus, was characterized as a pandemic by the World Health Organization. The rapid spread has resulted in authorities implementing numerous measures to contain the virus, such as travel restrictions, social distancing requirements, quarantines, shelter-in-place orders or voluntarily adopted practices, and business shutdowns.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 670 of 1730

We have taken measures to minimize the health risks of COVID-19 to our staff, patients, healthcare providers and their communities, as their safety and well-being are our top priority. In the U.S., our employees are working remotely when possible, while in China they have returned to work in our offices, manufacturing plants, and are performing medical affairs out in the field. While we have seen some impacts from COVID-19, such as slower enrollment in our clinical trials, particularly our Phase 3 IPF program, we do not know if, or to what extent, these effects will continue in the future, as the impact of the COVID-19 pandemic continues to unfold. The effect on our operational and financial performance beyond those effects described above, including any impact on sales of roxadustat, will depend in large part on future developments with the pandemic, which cannot be predicted with confidence at this time. Future developments include the duration, scope, and severity of the COVID-19 pandemic, the actions taken to contain or mitigate its impact, the impact on governmental programs and budgets, the impact on healthcare systems and operating procedures, the development of treatments or vaccines, and the resumption of widespread economic activity. Due to the inherent uncertainty of the largely unprecedented and rapidly evolving situation, we are unable to predict with any confidence the likely impact of the COVID-19 pandemic on our future operations.

The financial results for the year ended December 31, 2020 were not significantly impacted by COVID-19 relative to prior years. However, we will continue to monitor, and to the extent possible, mitigate the impact of the COVID-19 pandemic on our business.

Financial Highlights

	Years Ended December 31,							
		2020		2019	2018			
		(in th	ousa)				
Result of Operations								
Revenue	\$	176,319	\$	256,577	\$	212,958		
Operating costs and expenses		368,199		345,891		299,651		
Net loss		(189,291)		(76,970)		(86,420)		
Net loss per share - basic and diluted	\$	(2.11)	\$	(0.89)	\$	(1.03)		
				December 31, 2020		December 31, 2019		
				(in thou	is)			
Balance Sheet								
Cash and cash equivalents			\$	678,393	\$	126,266		
Short-term and long-term investments			\$	8,388	\$	468,609		
Accounts receivable			\$	41,883	\$	28,455		

Our revenue for the year ended December 31, 2020 included the revenues recognized related to the following:

- \$15.0 million regulatory milestone associated with the NDA approval in Japan;
- \$80.6 million development revenue recognized under collaboration agreements with our partners Astellas and AstraZeneca AB
 ("AstraZeneca");
- \$72.5 million of net product revenue from roxadustat commercial sales in China; and
- \$8.9 million of drug product revenue related to roxadustat bulk drug or active pharmaceutical ingredient ("API") deliveries to AstraZeneca and Astellas.

As comparison, our revenue for the year ended December 31, 2019 included the revenues recognized related to the following:

- \$130.0 million total of two regulatory milestones associated with the planned MAA submission to the EMA under the collaboration agreement
 with Astellas for roxadustat as a treatment for dialysis and non-dialysis CKD patients;
- \$50.0 million regulatory milestone associated with the NDA submission to the FDA under the collaboration agreement with AstraZeneca for roxadustat as a treatment for dialysis and non-dialysis CKD patients;
- \$22.0 million total of three regulatory milestones associated with roxadustat being included on the updated National Reimbursement Drug List ("NRDL") released by China's National Healthcare Security Administration ("NHSA");
- \$12.5 million regulatory milestone associated with the NDA approval in Japan; and
- \$36.3 million reduction in drug product revenue of a change in estimated variable consideration related to the API product revenue that was
 recognized in 2018, which reflected the total difference between estimated and actual listed price and yield from the manufacture of bulk
 product tablets.

Operating costs and expenses increased for the year ended December 31, 2020 compared to the prior year primarily due to the following:

- · Higher clinical trial expenses associated with post-approval safety studies in China, and commencement of Phase 3 trials for pamrevlumab;
- Higher drug development expenses associated with drug substance manufacturing activities related to pamrevlumab, partially offset by lower
 activities related to roxadustat and capitalization of inventory manufacturing costs;
- · Higher employee-related expenses primarily resulting from higher average compensation level and headcount;
- · Higher stock-based compensation expense, primarily due to the cumulative impact of stock option grant activities;
- Higher legal expenses primarily associated with patent-related activities in the United Kingdom;
- Lower sales and marketing expenses due to a reversal in co-promotion expenses with AstraZeneca as a result of the China Amendment between FibroGen China and AstraZeneca; and
- · Lower outside services due to lower consulting expenses and scientific contract work related to roxadustat Phase 3 and submission activities.

Our research and development expenses were \$252.9 million, \$209.3 million and \$235.8 million for the years ended December 31, 2020, 2019 and 2018, respectively. Since inception and through December 31, 2020, we have incurred a total of approximately \$2.2 billion in research and development expenses, a majority of which relates to the development of roxadustat, pamrevlumab and other HIF-PH inhibitors. We expect to continue to incur significant expenses and operating losses over at least the next several years and we expect our research and development expenses to increase in the future as we advance our product candidates through clinical trials and expand our product candidate portfolio. In addition, we expect to incur significant expenses relating to seeking regulatory approval for our product candidates and commercializing those products in various markets, including China. We consider the active management and development of our clinical pipeline to be particularly crucial to our long-term success. The process of conducting the necessary clinical research to obtain regulatory approval is costly and time consuming.

The actual probability of success for each of our product candidates and clinical programs, and our ability to generate product revenue and become profitable, depends upon a variety of factors, including the quality of the product candidate, clinical results, investment in the program, competition, manufacturing capability, commercial viability, and our and our partners' ability to successfully execute our development and commercialization plans. For a description of the numerous risks and uncertainties associated with product development, refer to "Risk Factors."

During the year ended December 31, 2020, we had a net loss of \$189.3 million, or net loss per basic and diluted share of \$2.11, as compared to a net loss of \$77.0 million, or net loss per basic and diluted share of \$0.89 for the prior year, primarily due to a decrease in revenue and an increase in operating expenses.

Cash and cash equivalents, investments and accounts receivable totaled \$728.7 million at December 31, 2020, an increase of \$105.4 million from December 31, 2019, primarily due to cash provided by operations.

Collaboration Partnerships for Roxadustat

Our current and future research, development, manufacturing and commercialization efforts with respect to roxadustat and our other product candidates currently in development depend on funds from our collaboration agreements with Astellas and AstraZeneca as described below.

Astellas

In June 2005, we entered into a collaboration agreement with Astellas for the development and commercialization (but not manufacture) of roxadustat for the treatment of anemia in Japan ("Japan Agreement"). In April 2006, we entered into the Europe Agreement with Astellas for roxadustat for the treatment of anemia in Europe, the Commonwealth of Independent States, the Middle East, and South Africa. Under these agreements, we provide Astellas the right to develop and commercialize roxadustat for anemia indications in these territories.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 672 of 1730

We share responsibility with Astellas for clinical development activities required for the U.S. and the Europe regulatory approval of roxadustat, and share equally those development costs under the agreed development plan for such activities. Astellas will be responsible for clinical development activities and all associated costs required for regulatory approval in all other countries in the Astellas territories. Astellas will own and have responsibility for regulatory filings in its territories. We are responsible, either directly or through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the agreements. Astellas is responsible for roxadustat commercialization activities in the Astellas territories.

The Astellas agreements will continue in effect until terminated. Either party may terminate the agreements for certain material breaches by the other party. In addition, Astellas will have the right to terminate the agreements for certain specified technical product failures, upon generic sales reaching a particular threshold, upon certain regulatory actions, or upon our entering into a settlement admitting the invalidity or unenforceability of our licensed patents. Astellas may also terminate the agreements for convenience upon advance written notice to us. In the event of any termination of the agreements, Astellas will transfer and assign to us the regulatory filings for roxadustat and will assign or license to us the relevant trademarks used with the products in the Astellas territories. Under certain terminations, Astellas is also obligated to pay us a termination fee.

Consideration under these agreements includes a total of \$360.1 million in upfront and non-contingent payments, and milestone payments totaling \$557.5 million, of which \$542.5 million are development and regulatory milestones and \$15.0 million are commercial-based milestones. Total consideration, excluding development cost reimbursement and product sales-related payments, could reach \$917.6 million. The aggregate amount of such consideration received through December 31, 2020 totals \$645.1 million.

Additionally, under these agreements, Astellas pays 100% of the commercialization costs in their territories. In Europe, Astellas will pay us a tiered transfer price for our manufacture and supply of roxadustat based on net sales of roxadustat in the low 20% range. In Japan, Astellas pays us a transfer price in the low 20% range of the list price published by the Japanese Ministry of Health, Labour and Welfare, adjusted for certain elements.

During the fourth quarter of 2020, the Japanese Ministry of Health, Labour and Welfare approved EVRENZO® (roxadustat) for the treatment of anemia of CKD in adult patients not on dialysis. Accordingly, the consideration of \$15.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the Japan Agreement in the fourth quarter of 2020, substantially all of which was recognized as revenue during the year ended December 31, 2020 from performance obligations satisfied or partially satisfied.

In September 2019, the Japanese Ministry of Health, Labour and Welfare approved roxadustat for the treatment of anemia associated with dialysis CKD patients. Accordingly, the consideration of \$12.5 million associated with this milestone was included in the transaction price and allocated to performance obligations under the Japan Agreement in the third quarter of 2019. This milestone payment was received in October 2019.

During the second quarter of 2019, we received positive topline results from analyses of pooled major adverse cardiovascular event ("MACE") and MACE+ data from its Phase 3 trials evaluating roxadustat as a treatment for dialysis and non-dialysis CKD patients, enabling Astellas to prepare for an MAA submission to the EMA in the second quarter of 2020, following our NDA submission to the FDA in 2019 and acceptance for review in February 2020. These milestones became probable of being achieved in the second quarter of 2019, and substantially all of the total consideration of \$130.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the Europe Agreement in the second quarter of 2019, of which \$128.8 million was recognized as revenue during 2019, and \$0.8 million was recognized as revenue during 2020, from performance obligations satisfied or partially satisfied. According to the Europe Agreement, these milestone payments were billed to Astellas upon the submission of an MAA in the second quarter of 2020 and the total \$130.0 million was received during the same quarter.

In 2018, FibroGen and Astellas entered into an amendment to the Japan Agreement that will allow Astellas to manufacture roxadustat drug product for commercialization in Japan (the "Japan Amendment"). Under this amendment, FibroGen would continue to manufacture and supply roxadustat API to Astellas. The commercial terms of the Japan Agreement relating to the transfer price for roxadustat for commercial use remain substantially the same, reflecting an adjustment for the manufacture of drug product by Astellas rather than FibroGen. We fulfilled delivery of a total of \$64.8 million API under this amendment in 2018. In 2019, a change in estimated variable consideration resulted in a \$36.3 million reduction to revenue associated with these API shipments, at the time the listed price for roxadustat was issued by the Japanese Ministry of Health, Labour and Welfare, which reflected the total difference between estimated and actual listed price and yield from the manufacture of bulk product tablets. In addition, in 2020, we recorded another \$4.0 million reduction to revenue associated with these API shipments, related to a change in estimated variable consideration, based on the API held by Astellas at March 31, 2020 adjusted to reflect the updated listed price for roxadustat issued by the Japanese Ministry of Health, Labour and Welfare and possible future changes to the listed price, adjusted for the timing of and estimated bulk product strength mix intended to be manufactured by Astellas, estimated cost to convert the API to bulk product tablets, and estimated yield from the manufacture of bulk product tablets, among others.

During the second quarter of 2020, we fulfilled delivery obligations under the term of the Japan Amendment, and recognized related drug product revenue of \$8.2 million in the same period. The amount represents variable consideration and was estimated based on the quantity of product shipped, actual listed price for roxadustat issued by the Japanese Ministry of Health, Labour and Welfare and possible future changes to the listed price, adjusted for the timing of and estimated bulk product strength mix intended to be manufactured by Astellas, estimated cost to convert the API to bulk product tablets, and estimated yield from the manufacture of bulk product tablets, among others.

During the fourth quarter of 2020, we shipped bulk drug product from process validation supplies for commercial sales under the term of the Europe Agreement. We constrained the estimated variable consideration due to a high degree of uncertainty associated to the final consideration because of an extended length of time over which the considerations may be adjusted. As a result, we constrained the consideration from this shipment, and recorded \$1.4 million as current deferred revenue and \$4.6 million as long-term deferred revenue as of December 31, 2020. The deferred revenue will be recognized over the duration of the contract and when uncertainty is resolved.

In the fourth quarter of 2018, we were engaged in the final stages of review with our partners over the proposed development of roxadustat for the treatment of chemotherapy-induced anemia. AstraZeneca and Astellas approved the program in December 2018 and January 2019, respectively. Costs associated with the development of this indication are shared 50-50 between our two partners. For revenue recognition purposes, we concluded that this new indication represents a modification to the Europe agreements and will be accounted for separately, meaning the development costs associated with the new indications are distinct from the original development costs. The development service period for roxadustat for the treatment of CIA under the Europe Agreement is estimated to continue through the end of 2023 to allow for development of this indication.

In addition, as of December 31, 2020, Astellas had separate investments of \$80.5 million in the equity of FibroGen, Inc.

AstraZeneca

In July 2013, we entered into the U.S./RoW Agreement a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in the U.S. and all territories not previously licensed to Astellas, except China. In July 2013, through our China subsidiary and related affiliates, we entered into the China Agreement a collaboration agreement with AstraZeneca for roxadustat for the treatment of anemia in China. Under these agreements, we provide AstraZeneca the right to develop and commercialize roxadustat for anemia in these territories. We share responsibility with AstraZeneca for clinical development activities required for U.S. regulatory approval of roxadustat, and FibroGen will transfer the U.S. NDA to AstraZeneca upon approval. AstraZeneca will hold the equivalent regulatory filings in the other licensed countries.

In 2015, we reached the \$116.5 million cap on our initial funding obligations (during which time we shared 50% of the joint initial development costs), therefore all development and commercialization costs for roxadustat for the treatment of anemia in CKD in the U.S., Europe, Japan and all other markets outside of China have been paid by Astellas and AstraZeneca since reaching the cap.

In China, FibroGen (China) Medical Technology Development Co., Ltd. ("FibroGen Beijing") will conduct the development work for CKD anemia, will hold all of the regulatory licenses issued by China regulatory authorities, and will be primarily responsible for regulatory, clinical and manufacturing. China development costs are shared 50/50. AstraZeneca is also responsible for 100% of development expenses in all other licensed territories outside of China. Outside of China, we are responsible, through our contract manufacturers, for the manufacture and supply of all quantities of roxadustat to be used in development and commercialization under the AstraZeneca agreements.

Under the AstraZeneca agreements, we will receive upfront and subsequent non-contingent payments totaling \$402.2 million. Potential milestone payments under the agreements total \$1.2 billion, of which \$571.0 million are development and regulatory milestones and \$652.5 million are commercial-based milestones. Total consideration under the agreements, excluding development cost reimbursement, transfer price payments, royalties and profit share, could reach \$1.6 billion. The aggregate amount of such consideration received through December 31, 2020 totals \$516.2 million.

Under the U.S./RoW Agreement, AstraZeneca will pay for all commercialization costs in the U.S. and RoW and AstraZeneca will be responsible for the U.S. commercialization of roxadustat, with FibroGen undertaking specified commercial activities in the U.S. In addition, we will receive a transfer price for delivery of commercial product based on a percentage of net sales in the low- to mid-single digit range and AstraZeneca will pay us a tiered royalty on net sales of roxadustat in the low 20% range.

Under the China Agreement, which is conducted through FibroGen China Anemia Holdings, Ltd. ("FibroGen Cayman"), FibroGen Beijing, and FibroGen International (Hong Kong) Limited (collectively, ("FibroGen China, the commercial collaboration was structured as a 50/50 profit share, which was amended by the China Amendment in the third quarter of 2020, as discussed and defined below in *China Amendment*.

AstraZeneca may terminate the U.S./RoW Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon 180 days prior written notice at will. If AstraZeneca terminates the U.S./RoW Agreement at will, in addition to any unpaid non-contingent payments, it will be responsible for paying for a substantial portion of the post-termination development costs under the agreed development plan until regulatory approval.

AstraZeneca may terminate the China Agreement upon specified events, including our bankruptcy or insolvency, our uncured material breach, technical product failure, or upon advance prior written notice at will. If AstraZeneca terminates our China Agreement at will, it will be responsible for paying for transition costs as well as make a specified payment to FibroGen.

In the event of any termination of the agreements, but subject to modification upon termination for technical product failure, AstraZeneca will transfer and assign to us any regulatory filings and approvals for roxadustat in the affected territories that they may hold under our agreements, grant us licenses and conduct certain transition activities.

As mentioned above, during the second quarter of 2019, we received positive topline results from analyses of pooled MACE and MACE+ data from its Phase 3 trials for roxadustat, enabling our U.S. NDA submission to the FDA. The regulatory milestone payment associated with this NDA submission became probable of being achieved in the second quarter of 2019. Accordingly, the consideration of \$50.0 million associated with this milestone was included in the transaction price and allocated to performance obligations under the combined arrangement in the second quarter of 2019, of which \$42.4 million was recognized as revenue during 2019, and \$0.6 million was recognized as revenue during 2020, from performance obligations satisfied or partially satisfied. We submitted such NDA to the FDA in December 2019, which was accepted for review in February 2020. According to the U.S/RoW Agreement, this milestone payment is billable to AstraZeneca when the NDA is accepted by the FDA. Therefore, this \$50.0 million milestone was billed during the first quarter of 2020, the payment of which was fully received in April 2020.

In December 2019, roxadustat has been included on the updated NRDL released by China's NHSA for the treatment of anemia in CKD, covering patients who are non-dialysis-dependent as well as those who are dialysis-dependent. Accordingly, the total consideration of \$22.0 million associated with these milestones was included in the transaction price and allocated to performance obligations under the combined arrangement in the fourth quarter of 2019. This milestone payment was fully received during the first quarter of 2020.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 675 of 1730

As mentioned above, in the fourth quarter of 2018, we were engaged in the final stages of review with our partners over the proposed development of roxadustat for the treatment of CIA. AstraZeneca and Astellas approved the program in December 2018 and January 2019, respectively. Costs associated with the development of this indication are expected to be shared 50-50 between our two partners. In addition to CIA, in December 2018, anemia of chronic inflammation and multiple myeloma have been approved for development by AstraZeneca and is expected to be fully funded by them. For revenue recognition purposes, we concluded that the approval of additional research and development services for these new indications represent modifications to our collaboration agreements in the periods in which approval was received. The research and development services associated with the new indications are distinct from other promises in our collaboration agreements, and will be accounted for separately. The development service period for roxadustat for the treatment of CIA, anemia of chronic inflammation and multiple myeloma under the AstraZeneca agreements is estimated to continue through the end of 2024, to allow for development of these additional indications.

China Amendment

On July 8, 2020, FibroGen China and AstraZeneca (together with FibroGen China, the "Parties") entered into an amendment, effective July 1, 2020, to the China Agreement, relating to the development and commercialization of roxadustat in China (the "China Amendment"). While the responsibilities of the Parties under the China Agreement remain largely the same, certain changes were made.

The China Amendment provides for the establishment of a jointly owned entity that will perform roxadustat distribution, as well as conduct sales and marketing through AstraZeneca. To prepare for the establishment of this jointly owned entity, in July 2020, FibroGen Beijing acquired Beijing Kangda Yongfu Pharmaceutical Co., LTD ("Kangda"). The purpose of the acquisition was to acquire a distribution license owned by Kangda for commercializing and distributing roxadustat in China. FibroGen Beijing continues to hold all of the regulatory licenses issued by China regulatory authorities and continues to be primarily responsible for regulatory, clinical, manufacturing, medical affairs and pharmacovigilance activities. In September 2020, FibroGen Beijing and AstraZeneca entered into an equity transfer agreement and shareholders agreement related to Kangda. Concurrently with the equity transfer, the two parties renamed Kangda to Beijing Falikang Pharmaceutical Co. Ltd. ("Falikang"). See Note 3, *Acquisition and Variable Interest Entity*, to the consolidated financial statements for details.

As Falikang is a distribution entity for roxadustat and AstraZeneca is the final decision maker for all the roxadustat commercialization activities, we lack the power criterion while AstraZeneca meets both the power and economic criteria under ASC 810, to direct the activities of Falikang that most significantly impact its performance. Therefore, we are not the primary beneficiary of Falikang. As a result, we accounted for our investment in Falikang under the equity method, and Falikang is not consolidated into our consolidated financial statements. In addition, we recognized our proportionate share of the reported profits or losses of Falikang, as other income (loss) in the consolidated statement of operations, and as an adjustment to its investment in unconsolidated subsidiary in the consolidated balance sheet. Falikang has not incurred material profit or loss to date.

In accordance with the China Amendment, we are currently in the interim period. The interim period is defined as the period from April 1, 2020 to the time when Falikang is fully operational, which commenced in January 2021. During the interim period, FibroGen continues to sell product directly to the distributors, who remain as our customers. The calculation for profit or loss share has changed related to sales of roxadustat in China for the period from April 1, 2020 onwards. With effect from April 1, 2020, the Parties have changed the method under which commercial expenses incurred by AstraZeneca are calculated and billed. AstraZeneca's co-promotion expenses for their sales and marketing efforts are now subject to a cap of a percentage of net sales. Once AstraZeneca has been fully reimbursed for their sales and marketing costs under the cap, AstraZeneca will bill the co-promotion expenses based on actual costs on a prospective basis. In addition, the China Amendment has allowed for a higher cost of manufacturing incurred by FibroGen Beijing to be included in the profit or loss share calculation, subject to an annual cap, among other changes.

Once Falikang is fully operational, AstraZeneca will bill the co-promotion expenses to Falikang, rather than FibroGen Beijing. In addition, FibroGen Beijing will manufacture and supply commercial product to Falikang based on an agreed upon transfer price. Development costs will continue to be shared 50/50 between the Parties.

As a result, the interim period primarily includes the following activities:

- Co-promotion expenses: The China Amendment revised the payment arrangements and calculation of the historical unpaid co-promotion expenses to AstraZeneca for its sales and marketing efforts associated with the commercial sales for roxadustat in China since the product launch. Under the previous China Agreement, payment of these historical co-promotion expenses was subject to certain profitability and cash flow thresholds. No amount of the historical co-promotion costs had been paid prior to the China Amendment as these thresholds had not yet been met. Under the China Amendment, a portion of the historical unpaid co-promotion expenses was adjusted to reduce the amount owed by FibroGen Beijing and the current period co-promotion expenses are capped at a percentage of net roxadustat sales in China. As a result, in the third quarter of 2020, we reversed approximately \$84.4 million of previously accrued co-promotion expenses payable, which was recorded as a reduction to selling, general and administrative expenses, where these expenses were initially recorded during the periods from the initiation of commercial activities in the first quarter of 2019 to the second quarter of 2020. The co-promotion expenses for the year ended December 31, 2020, capped at a percentage of net roxadustat sales in China, were \$27.2 million, included in the selling, general and administrative expenses. After this adjustment, as of December 31, 2020, \$16.9 million and \$11.5 million of the recalculated accrued co-promotion expenses were recorded in accounts payable and accrued liabilities, respectively, as they were anticipated to be paid within the next 12 months; and \$27.4 million of the recalculated accrued co-promotion expenses remained in the long-term liabilities, as it is not anticipated to be paid within the next 12 months.
- Profit share: Profit/loss share between FibroGen Beijing and AstraZeneca is based on a calculation of the current period net roxadustat sales in China and deductible expenses pursuant to the China Agreement. Based on the calculation revised under the China Amendment, profit was achieved during the third and fourth quarter of 2020. As a result, we recorded a profit share liability of \$7.0 million to AstraZeneca as of December 31, 2020 in the accrued and other current liabilities, which correspondingly reduced the deferred revenue related to the performance obligation in accordance with the China Agreement.

FibroGen, Inc. and AstraZeneca concurrently amended the U.S./RoW Agreement to reflect minor changes in the governance structure under the China Agreement.

Starting in the first quarter of 2021, our revenue will be made of 1) a transfer price from our sales to Falikang, and 2) sales made directly by FibroGen Beijing to distributors who have not transitioned to Falikang. The transfer price earned is expected to be in the range of 30-45% of Falikang's net sales, which reflects the fact that Falikang will pay AstraZeneca the commercialization expenses and AstraZeneca's profit share. For revenue recognition purposes, we estimate the total consideration on a per unit basis and recognize as we transfer control of the commercial drug product to Falikang.

Additional Information Related to Collaboration Agreements

Of the \$1.1 billion in development and regulatory milestones payable in the aggregate under our Astellas and AstraZeneca collaboration agreements, \$425.0 million is payable upon achievement of milestones relating to the submission and approval of roxadustat in dialysis-dependent CKD and non-dialysis-dependent CKD in the U.S. and Europe.

For more detailed discussions on the accounting for these agreements, refer to Note 4, Collaboration Agreements and Revenues, to the consolidated financial statements.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 677 of 1730

Total cash consideration received through December 31, 2020 and potential cash consideration, other than development cost reimbursement, transfer price payments, royalties and profit share, pursuant to our existing collaboration agreements are as follows:

	Cash Received Through December 31, 2020		Additional Potential <u>Cash Payments</u> (in thousands)		Total Potential Cash Payments	
Astellasrelated-party:						
Japan Agreement	\$	105,093	\$	67,500	\$	172,593
Europe Agreement		540,000		205,000		745,000
Total Astellas		645,093		272,500		917,593
AstraZeneca:						
U.S. / RoW Agreement		439,000		810,000		1,249,000
China Agreement		77,200		299,500		376,700
Total AstraZeneca		516,200		1,109,500		1,625,700
Total revenue	\$	1,161,293	\$	1,382,000	\$	2,543,293

These collaboration agreements also provide for reimbursement of certain fully burdened research and development costs as well as direct out of pocket expenses.

RESULTS OF OPERATIONS

Revenue

	Years Ended December 31,							Change 2020 vs	. 2019
	2020		2019		2018			\$	%
				(0	dollars	in thousand	s)		
Revenue:									
License revenue	\$	14,323	\$	177,086	\$	22,269	\$	(162,763)	(92) %
Development and other revenue		80,592		114,115		125,913		(33,523)	(29) %
Product revenue, net		72,498		1,700		-		70,798	4,165 %
Drug product revenue		8,906		(36,324)		64,776		45,230	(125) %
Total revenue	\$	176,319	\$	256,577	\$	212,958	\$	(80,258)	(31) %

Our revenue to date has been generated substantially from our collaboration agreements with Astellas and AstraZeneca. In addition, we started roxadustat commercial sales in China in the third quarter of 2019.

Under our revenue recognition policy, license revenue includes amounts from upfront, non-refundable license payments and amounts allocated pursuant to the standalone selling price method from other consideration received during the periods. This revenue is generally recognized as deliverables are met and services are performed. License revenues represented 8%, 69% and 11% of total revenues for the years ended December 31, 2020, 2019 and 2018, respectively.

Development revenue includes co-development and other development related services. Co-development services are recognized as revenue in the period in which they are billed to our partners, excluding China. For China co-development services, revenue is deferred until we begin to transfer control of the manufactured commercial drug product to AstraZeneca.. Other development related services are recognized as revenue over the noncontingent development period based on a proportional performance method. As of December 31, 2020, the estimated future non-contingent development periods range from 3 to 48 months. Other revenues consist of sales of research and development material and have not been material for any of the periods presented. Development and other revenues represented 46%, 44% and 59% of total revenues for the years ended December 31, 2020, 2019 and 2018, respectively.

We started generating net product revenue from commercial sales of roxadustat drug product in China in the third quarter of 2019. Product revenue is recognized when our customer obtains control of promised goods or services in an amount that reflects the consideration we expect to receive in exchange for those goods or services. Product revenue represented 41% and 1% of total revenue for the year ended December 31, 2020 and 2019, respectively.

Drug product revenue includes commercial-grade API or bulk drug product sales to AstraZeneca and Astellas in support of pre-commercial preparation prior to the NDA or MAA approval, and to Astellas for ongoing commercial launch in Japan. Drug product revenue is recognized when we fulfill the delivery obligations. The amount of variable consideration that is included in the transaction price may be constrained, and is included in the drug product revenue only to the extent that it is probable that a significant reversal in the amount of the cumulative revenue recognized will not occur in a future period when the uncertainty associated with the variable consideration is subsequently resolved. Actual amounts of consideration ultimately received in the future may differ from our estimates, for which we will adjust these estimates and affect the drug product revenue in the period such variances become known. Drug product revenues represented 5%, (14)% and 30% of total revenues for the years ended December 31, 2020, 2019 and 2018, respectively.

In the future, we will continue generating revenue from collaboration agreements in the form of license fees, milestone payments, reimbursements for collaboration services and royalties on product sales, and from product sales. We expect that any revenues we generate will fluctuate from quarter to quarter due to the uncertain timing and amount of such payments and sales.

Total revenue decreased \$80.3 million, or 31% for the year ended December 31, 2020 compared to the year ended December 31, 2019 for the reasons discussed in the sections below.

License Revenue

	Years Ended December 31,						Change 2020 vs. 2019		
	 2020		2019		2018		\$	%	
			(0	lollars	in thousands)			
License revenue:									
Astellas	\$ 14,323	\$	129,405	\$	14,323	\$	(115,082)	(89) %	
AstraZeneca	-		47,681		7,946		(47,681)	(100)%	
Total license revenue	\$ 14,323	\$	177,086	\$	22,269	\$	(162,763)	(92) %	

License revenue decreased \$162.8 million, or 92% for the year ended December 31, 2020 compared to the year ended December 31, 2019.

License revenue recognized under our collaboration agreements with Astellas decreased \$115.1 million, or 89% for the year ended December 31, 2020 compared to the year ended December 31, 2019. License revenue recognized under our collaboration agreements with Astellas for the year ended December 31, 2020 represented the allocated revenue of related to a regulatory milestone of \$15.0 million associated with the NDA approval in Japan achieved during the fourth quarter of 2020. License revenue recognized under our collaboration agreements with Astellas for the year ended December 31, 2019 represented the allocated revenue of \$117.5 million related to two regulatory milestones totaling \$130.0 million associated with the planned MAA submission in Europe that were included in the transaction price during the second quarter of 2019 when these milestones became probable of being achieved; and the allocated revenue of \$11.9 million related to a regulatory milestone of \$12.5 million associated with the NDA approval in Japan achieved during the third quarter of 2019.

We did not have any license revenue under our collaboration agreements with AstraZeneca for the year ended December 31, 2020. License revenue recognized under our collaboration agreements with AstraZeneca for the year ended December 31, 2019 represented the revenue allocated to the U.S./RoW license of \$33.1 million related to a regulatory milestone of \$50.0 million associated with the NDA submission in the U.S. that was included in the transaction price during the second quarter of 2019 when this milestone became probable of being achieved; and the revenue allocated to the U.S./RoW license of \$14.6 million related to three regulatory milestones totaling \$22.0 million associated with roxadustat being included on the updated NRDL released by China's NHSA during the fourth quarter of 2019.

Development and Other Revenue

	Years Ended December 31,							Change 2020 vs. 2019		
	2020		2019		2018		\$		%	
			(dollars in thousands							
Development revenue:										
Astellas	\$	19,174	\$	29,394	\$	20,903	\$	(10,220)	(35) %	
AstraZeneca		61,418		84,719		104,970		(23,301)	(28) %	
Total development revenue		80,592		114,113		125,873		(33,521)	(29) %	
Other revenue		-		2		40		(2)	(100)%	
Total development and other revenue	\$	80,592	\$	114,115	\$	125,913	\$	(33,523)	(29) %	

Development and other revenue decreased \$33.5 million, or 29% for the year ended December 31, 2020 compared to the year ended December 31, 2019

Development revenue recognized under our collaboration agreements with Astellas decreased \$10.2 million, or 35% for the year ended December 31, 2020 compared to the year ended December 31, 2019. Development revenue recognized under our collaboration agreements with Astellas for the year ended December 31, 2020 included the allocated revenue of \$0.7 million related to the above-mentioned \$15.0 million associated with the NDA approval in Japan achieved during the fourth quarter of 2020. Development revenue recognized under our collaboration agreements with Astellas for the year ended December 31, 2019 included the allocated revenue of \$11.4 million related to the above-mentioned \$130.0 million associated with the regulatory milestones of the planned MAA submission in Europe, and the allocated revenue of \$0.5 million related to the above-mentioned \$12.5 million associated with the NDA approval in Japan. The decrease for the year ended December 31, 2020 was partially offset by an increase in co-development billings related to related to higher medical affairs activities under the Europe Agreement.

Development revenue recognized under our collaboration agreements with AstraZeneca decreased \$23.3 million, or 28% for the year ended December 31, 2020 compared to the year ended December 31, 2019, primarily due to a decrease in co-development billings related to the development of roxadustat as a result of the substantial completion of Phase 3 trials for roxadustat. Development revenue recognized under our collaboration agreements with AstraZeneca for the year ended December 31, 2019 also included the allocated revenue of \$9.3 million related to the above-mentioned \$50.0 million associated with the regulatory milestone of the NDA submission in the U.S., and the allocated revenue of \$4.1 million related to the above-mentioned regulatory milestones totaling \$22.0 million associated with roxadustat being included on the updated NRDL released by China's NHSA.

Product Revenue, Net

		Years Ended	Decen	ıber 31,	Change 2020 vs. 2019			
	2020			2019	\$	%		
				ısands)				
Gross revenue	\$	89,027	\$	2,803 \$	86,224	3,076 %		
Price adjustment		-		(936)	936	(100) %		
Non-key account hospital listing award		(9,325)		-	(9,325)	100 %		
Contractual sales rebate		(6,189)		(149)	(6,040)	4,054 %		
Other discounts and rebates		(923)		(18)	(905)	5,028 %		
Sales return		(92)		-	(92)	100 %		
Product revenue, net	\$	72,498	\$	1,700	70,798	4,165 %		

We started roxadustat commercial sales in China in the third quarter of 2019. Therefore, the year-over-year comparison would not be meaningful, as the prior year was at limited sales volume.

The gross product revenue for the year ended December 31, 2020 was \$89.0 million.

In the second quarter of 2020, we amended the agreement with our pharmaceutical distributors, which triggered accounting modifications particularly related to non-key account hospital listing award. For the year ended December 31, 2020, the non-key account hospital listing award was \$9.3 million, which was recorded as a reduction to the revenue and calculated based on eligible non-key account hospital listing to date achieved by each distributor with certain requirements met during the period.

CERTIFICATION

- I, Enrique Conterno, certify that;
- 1. I have reviewed this annual report on Form 10-K of FibroGen, Inc.;
- 2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;
- 3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;
- 4. The registrant's other certifying officer(s) and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in the Exchange Act Rules 13a-15(f) and 15d-15(f)) for the registrant and have:
- (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;
- (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;
- (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and
- (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and
- 5. The registrant's other certifying officer(s) and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):
- (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and
- (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.

Presentation

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And good afternoon, everybody, and thank you for joining us for the second day of the 41st Annual Cowen Healthcare Conference. I'm Yaron Werber, biotech analyst here at Cowen with my colleague, Brendan Smith. And it's a great pleasure for us to moderate the fireside chat with FibroGen.

Today, we have Enrique Conterno, who's the CEO; and Mike Tung, VP of Investor Relations and Strategy. Gentlemen, thanks so much for joining us. We appreciate it.

Enrique A. Conterno

CEO & Director

Thank you very much for the invitation, Yaron.

Question and Answer

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Absolutely. So Enrique, maybe the timing for this is good in a way, just given some of the news from yesterday, obviously, wasn't herbed our ways by chance. But maybe give us a little bit of a sense related to the news flow from yesterday, what you can share with us on the interaction with FDA or the next steps in the process?

Enrique A. Conterno

CEO & Director

Yes. Maybe -- I do appreciate the opportunity to be able to share. We had our earnings call yesterday. So this is an opportunity to basically maybe describe some of the events. And let me start with the extension that we had. As you know, last December, in the final stages of review, the FDA extended the review period of the roxadustat NDA by 3 months to review additional analysis of clinical data.

And at that time, set a new PDUFA date of March 20, 2021. Yesterday, we were informed by the FDA that they plan to hold an advisory committee or an Adcom to review the NDA for roxadustat in the U.S. We have not received a confirmed date for this planned outcome. We were surprised by the request, I think in 3 separate occasions. The FDA let us know that they were not planning to hold an Adcom at that time, whether it was -- when the NDA filing was accepted during the mid-cycle review and then in the late cycle review.

It is not unusual for the FDA to hold an Adcom for a first-in-class new molecular entity. And in fact, we shared last spring that we were preparing for -- very much for that possibility. So now I think for us, we are refocusing our efforts on resuming those activities. I'm very much looking forward now to presenting the comprehensive roxadustat data in that public saying. We continue to have confidence in the completeness of the NDA submission and the strength of the roxadustat data. And we're very much -- both FibroGen and AstraZeneca committed to working with the FDA to bring roxadustat to patients with an anemia CKD in the U.S. as soon as possible.

So clearly, as you can appreciate and as we've mentioned this in the past, we are not in a position to discuss the detail of our FDA interactions, but I look forward to having discussion about this topic. And of course, I think also the broader agenda that FibroGen has.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Absolutely. So Enrique, just to set the stage a little bit, historically. My impression is that ESAs were originally submitted for approval 25 years ago to the Hematology division, and I believe ODAC probably reviewed them back then. About 13, 14 years ago, during the FDA's review of the safety issues of ESAs, remember, there was a -- I think it was 2007, there was a cardiorenal committee that look at dialysis and pre-dialysis in 2008, it was about a year later, ODAC reviewed relating to the safety issues of oncology.

Roxa was filed to the Hematology division. Can you give us the history on that? And how did cardiorenal this time around get involved, the Cardiorenal division within the review?

Enrique A. Conterno

CEO & Director

Yes. I think it's a really good question. So let's take it step by step. First, I think, clearly, roxa was filed with the Hematology division. Keep in mind that the Hematology division that we're speaking of is part of the office of the ocean office. So this includes cardiology, hematology, endocrinology and nephrology which are all part of that division.

There was a realignment where benign hematology basically was brought into in that office separately from the rest of oncology. So it is part of the same office, and it is that office and cardiorenal is -- it is part of that same office, right? In the past, when you're thinking about ODAC, the alignment of the FDA of the divisions to the office was different. Hematology was basically part of a different office.

So that realignment occurred, if I remember correctly, maybe about 18 months ago. So it is not -- we don't view it as unusual for cardiorenal to be focused on the host in the advisory committee. And quite frankly, we view it as a positive for us. We think that we will have the appropriate expertise to make sure that the product is reviewed with -- through -- with nephrologists and cardiologists' inputs.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And so do you have a sense on how did cardiorenal get involved? Was there a request from hematology? Do they need to ask cardiorenal for help, and that's ultimately how an Adcom is called for by cardiorenal, just logistically, how does things even work between divisions?

Enrique A. Conterno

CEO & Director

Honestly, I don't know that question. But I do know that it is the office really, that is -- has discretion to call for the Adcom. And at this point in time, it's a cardiorenal Adcom. And we just look forward to presenting the data. But I don't know the -- how that decision was made by the FDA.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And have all the interactions so far, during the review process, been with hematology? Or was there some interaction with cardiorenal at some point, given this is a renal indication?

Enrique A. Conterno

CEO & Director

Yes. No, really, I think that review has been with the hematology division, we do not know, of course, the interaction within the agents itself.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Got it. And has there been any change in the reviewers at FDA side?

Enrique A. Conterno

CEO & Director

We're not commenting, as you know, on our FDA interactions or any type of details. I think at this point in time, I think our -- and keep in mind that these news are also -- we were informed yesterday, literally. So at this point in time, our focus is on basically preparing. As you can imagine, we need to look for any type of precedent here is what are some of the precedence we will do some work around that.

But at the end, I think we know that an Adcom is an opportunity to basically showcase, I think, the strength of our data, and we continue to have confidence on the strength of the data of roxadustat across both DD and NDD.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And for a long time from your interaction with FDA, I think the comments to you were that FDA was not planning on calling an Adcom at that time. And that can always obviously change over time. Any sense -- it sounds like you're literally sort of on the 1-yard line, it was sort of the sense we're getting both from your comment and AstraZeneca's comments, when there was a last-minute request for more information, probably somewhere high up in the division. I imagine, at that point, it's probably the last review, sort of a

higher up in the division. So any -- can you give us just chronologically maybe what happened that led to the, obviously, the PDUFA extension and now to the Adcom?

Enrique A. Conterno

CEO & Director

Yes. I think as you mentioned, we were in the -- very much in the final stages of our review. I think we had mentioned that we were in label negotiation back -- all the way back since maybe August, late August, early September. And we -- very late in the review, we were requested additional analysis, which basically, given the imminence of the PDUFA date, basically required a PDUFA extension.

It is -- we've gone through those. We, of course, submitted the requested analysis. And at this stage, I think we were notified by the FDA that they are requesting an Adcom. It's difficult for us, as you can imagine, to speculate on the rationale for calling an Adcom. An Adcom is -- was very much a possibility throughout the review, but it's highly unusual at this stage in the process, right? So had you asked me a year ago, I would have said that was very much a possibility.

In fact, we were very upfront that we were preparing for one. But -- and quite frankly, it is an opportunity for us to basically discuss the data in a public forum. The issue is really the timing, right, than the overall process.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

I guess it's more of an issue. I mean, obviously, that could delay approval time lines, but is the issue more along the lines that now that PDUFA will lapse the March 20 PDUFA, by definition, is going to have to lapse just given the statue to give you almost 2 months' notice before a panel is called. The -- so is the next step for the FDA to give you a -- announce an Adcom and you go to an Adcom and thereafter, they'll finish their review or they're not going to finish the review, give you correspondence -- official correspondence and then have a panel, right?

Enrique A. Conterno

CEO & Director

No, I think a panelist can be held under an ongoing review. So I think, yes, I think the PDUFA date under this scenario would lapse, and the PDUFA date is March 20 of this year, so it's coming up quickly. And the FDA will probably notify us of the dates for the Adcom. And then I think post the Adcom being held, I think the FDA will basically make a decision. But there would not be a new PDUFA date given the PDUFA date can only be extended once.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

One of the questions -- I'm sort of taking questions as they come along. On the question is, to the extent, in the best of your ability what you can comment on, what do you think might be discussed at an Adcom? What could be some of the topics that FDA and also you would want to air publicly during an Adcom?

Enrique A. Conterno

CEO & Director

I think during the Adcom, I think typically, broadly, you want to basically showcase the benefit risk profile of the product across both of DD indications, DD and NDD. And -- but it's difficult for us at this stage without receiving the formal notification and having a discussion -- a fuller discussion with the FDA for us to speculate right now on the focus of the Adcom.

I think we will learn more of that as time goes by, and we engage with the FDA. And even at that point in time, I think we will have to make -- we will need to have a view of what is that we will be able to share at that point.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Has there been any more data requests since submitted the data, I presume around December 20?

Enrique A. Conterno

CEO & Director

Yes. We're not commenting on that. What I can say is that all analysis that were requested were submitted.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Okay. Okay. Understood. I mean is this a case where hematology just doesn't feel that they have the right expertise in the renal space to be able to review, and that's the reason that the they're calling an Adcom? Or is it by definition? If they were to call a hematology Adcom, it would be composed of hematologists, which is probably not best suited for this product. So by definition, they have to go through cardiorenal to convene an Adcom?

Enrique A. Conterno

CEO & Director

I think if you look at it logically and given the expertise in nephrology and importance -- the importance to get the clinical feedback from nephrologists, I do think that cardiorenal is not only a logical choice, but also the welcome choice, I think, in our view, in terms of holding this Adcom. So we view that not just a profit, but the opportunity to ensure that we have -- and the expert review basically with the comments from all the appropriate expert parties.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Yes. I recall from some of your previous comments and also from your partners, AstraZeneca, based on the totality of the data for roxa, you're fairly comfortable, optimistic that the data should support a broad label. And the impression we were all getting is that you're marching towards that sort of outcome. When we look at the totality of the data, there is much less questions, at least in our view, in dialysis, given the alignment with the regulatory agencies ahead of time, entity was admittedly, be at risk. The protocol wasn't agreed to, and it was a reasonable protocol, but there was ultimately a lot of crossover.

There was -- the study was complicated. And the physical analysis was complicated. So when I think of the 2, we think dialysis is probably a huge unmet need. Non-dialysis, no product approved, maybe not quite as urgent and probably more complicated review process. Does that make sense, in your view, maybe is that something that might be discussed along the line?

Enrique A. Conterno

CEO & Director

Honestly, I think we feel highly confident about both DD and NDD. We think that the data, I think, supports -- the benefit risk profile, I think, supports both indications, the use of roxadustat, I think, across both populations. I know because we've discussed in the past, and I think I've been pretty clear in terms of what has been agreed with the FDA and what hasn't been agreed with FDA. I think that's known.

And at this point in time, we're heading through to an Adcom, I think, so we'll have the opportunity to fully showcase. Keep in mind, I think, also, I think when it comes to NDD, yes, we conducted our studies against placebo, but we did have a pretty significant impact on the reduction of transfusions. And when you look at the hazard ratio, it was 0.26. So really, really significant benefits in terms of lowering risk of transfusions.

We've also presented data from our clinical trials, the risk of transfusions dramatically increases for hemoglobin below 10 versus above 10, almost -- there's a 3 to 5x increase. So the opportunity for a product, for roxadustat, I think is very significant. Keep in mind that most of the NDD population is not

treated. We've shared that maybe about 14%, 15% of the population that goes to dialysis receive ESAs in the 12 months prior to going on to dialysis, that's really -- for people that are very late-stage with chronic kidney disease, that's pretty low number. So I think the opportunity here is basically to be able to treat many more patients, so that patients can benefit. And then we think the roxa can play a very important role there.

Yaron, I think you're on mute right now.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Yes. Thank you for that. The studies, I think yesterday, you mentioned on the call that the ASPEN and DENALI studies in the large -- well, we think in large dialysis clinics have completed enrollment in the dialysis setting. When -- is that data that you will share externally? Or is that data that was designed more to help those clinics understand about how to switch and how to incorporate roxa into their protocols?

Enrique A. Conterno

CEO & Director

I think both. We will -- we intend to share the data at an appropriate conference. But clearly, I think it is also allowing for us to understand roxadustat. I think the very specific settings are not -- yes, these are clinical trials, but in the very specific settings of dialysis or large dialysis organizations and thinking about the particular product also. It is important trials, and we are pleased that, that enrollment has concluded. And now I think we expect to report data in the second half of this year.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And so those are going to be essentially open-label studies that are going to looking at outcomes, pharmaco...

Enrique A. Conterno

CEO & Director

Yes. Yes, it's going to be looking at a number of factors. Clearly, the efficacy and safety of roxadustat was established by the global Phase III program, the pivotal Phase III programs, are known 3 programs in DD and 3 programs in NDD in terms of the submission to the FDA. And I think in this particular case, is just very specific trials adapted to the needs of the dialysis organizations to look at outcomes that they will be very much interested.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Okay. The -- when you think about one of the novelties of roxa is that there was an incident dialysis population, the prevalent dialysis population. And you haven't reported the data in incident dialysis. I mean obviously, presumably, you would expect -- you would ask for a broad label. I'm just trying to think about all the nuances during a review, discussion, the flexibility of dosing and dosing parameters, just parameters relating to switching from an ESA to roxa.

And then there's a complexity of other companies in the space mentioned that they were in agreement with FDA to run an NDD study against an ESA, and there was an understanding within that context, those modulators will inherit an ESA-like black box. When I think of a drug like roxa, you have your own parameters around your studies. ESAs have their own black box and many -- in many ways because of cancer promotion data, which is not relevant to roxa. So as I think about all the topics think you think are going to be critical for you and FDA to align on to then write a label, what are the parameters are we missing that maybe I didn't kind of bring up?

Enrique A. Conterno

CEO & Director

Yes. You're asking me to speculate on the thinking of the FDA here. But I think in general, I think the rationale that we provided for and the discussion that we had with the FDA at that time. And the rationale for conducting the trials related to placebo was related to most patients are untreated in this population. By the way, placebo is a higher hurdle, right? And when you look at the overall results, we showed comparability when it comes to these outcomes in the population.

So we feel good about our results. Now at the end, I think we need to go through the outcome, I'll be able to have a discussion for us to be able to fully answer, I think, the questions that you're asking.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Just remind us in pre-dialysis and maybe for both, the agreed-upon upper bound of the confidence interval, just remind us what you said publicly.

Enrique A. Conterno

CEO & Director

Yes. We -- what I said public is that there was no agreed-upon upper bound. I always commented, this was always a review issue with the FDA, meaning, at the end, the FDA needs to look at all of this data, and there's no established guidance, I think, in this particular therapeutic area. There is established guidance in diabetes when there is a particular upper bound of 1.8 to approve of product on 1.3 long-term to be able to -- for the probe to show and be able to exclude that risk of more than 30% potential increase.

I think in our case, and that's not something that -- what we agree with the FDA, the agreement that we had was related to the trial that will be included in the analysis and the submission as well as the statistical methodology that would be used. Clearly, throughout the review and as part of our submission, we always do a number of sensitivity analysis with the FDA, and we included that as part of our package. But 1.3 was not agreed upon pre-defined agreement on upper bound with the FDA.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And you're talking about both dialysis and pre-dialysis? Or you're mentioning in pre-dialysis?

Enrique A. Conterno

CEO & Director

I'm speaking broadly, broadly. Yes.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Okay. Yes. And I think the discussion really has been even with some of your competitors more in the 1 point -- the 15% and the 25% sort of range between FDA and EMA?

Enrique A. Conterno

CEO & Director

Yes. Clearly, I think when you look at -- I cannot speak for the comments of our competitor, but in your question about NDD, I think it's pretty clearly -- we basically would meet that anyways. But -- and even though we were relative to placebo, which is a higher hurdle from a safety perspective. I -- you also spoke about the dialysis population and you may recall that we presented, in particular, we're very excited and continue to be very excited about the incident dialysis data, where we basically show the statistical significant reduction on both MACE and MACE+ outcomes in that population.

And so we also think that, that's quite significant and quite important, given that, that's when the decision for a new anime treatment is made for patients that are started dialysis.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And what about with EMA? I think with EMA, if I -- my recollection is that there was more agreement and alignment. Can you maybe just discuss what you said publicly about that?

Enrique A. Conterno

CEO & Director

We haven't commented on EMA, I think Astellas is the sponsor for EMA not FibroGen. And FibroGen, we were the ones that submitted the NDA. That review is ongoing, and I think what we shared yesterday was that we expect the decision sometime around the middle of the year.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

And that's from the CHMP initially?

Enrique A. Conterno

CEO & Director

Well, just yes, not just an opinion, but we are -- my comments about the beginning of the year is around approval.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Around approval? Okay, right. So we should even find out over the next maybe even 1 or 2 months really, but depending on the definition of -- from the CHMP. Okay. I -- Brendan, do you want to ask maybe [Audio Gap] and MDS?

Brendan Mychal Smith

Cowen and Company, LLC, Research Division

Sure. Sure. Yes, I know you have a couple of other studies going on outside of the CKD anemia space. So can you kind of just give us a really quick update with the enrollment status is for the MDS study and CIA. And kind of just confirm when we're going to see data from each of these and what that would maybe look like?

Enrique A. Conterno

CEO & Director

Yes. I think CIA is fully enrolled, and we expect to have basically the readout for that in the second half of this year, that's a Phase II study. And assume this study is positive, we expect to start of the phase III trial in chemo-induced anemia. The opportunity is very significant, and we basically, from a scale perspective, magnitude perspective, the opportunity is almost comparable to the opportunity that we see across CKD anemia. In the case of MDS, this is a Phase III trial, which is ongoing. And we've shared that we expect to report data in the first half of next year.

And clearly, I think it's very much an unmet medical need. And we feel that roxadustat can be an important treatment option in that setting. Of course, we need to wait for the Phase III results, but we are looking forward to concluding the trial as soon as possible.

Brendan Mychal Smith

Cowen and Company, LLC, Research Division

Got it. So I mean, obviously, MDS is kind of exploded with competition more recently. So I guess, can you kind of give us just a sense of how you're approaching the commercial opportunity there? And where you really see roxa kind of fitting in versus some of the other options that are available?

Enrique A. Conterno

CEO & Director

Yes. I think there's been additional options that are available today. I think those options tend to have a narrower set of patients or indications, although they are pursuing studies that are broader. Keep in mind, in our studies, we include both R positive and R negative patients, and also patients that were regardless of failure to ESAs agents. So we feel that the roxadustat's approach basically covers a very significant amount of patients. So we could have broad applicability, of course, we need to look at the results. But the results so far that we've seen, I think, tend to indicate that we have a product that is effective, and we need to see the final Phase III results to fully understand the profile of the product.

But we feel confident about our -- the potential utilization of roxadustat in this scene.

Brendan Mychal Smith

Cowen and Company, LLC, Research Division

Okay. Great. And I know we just have a couple of minutes left. I want to ask 1 quick one on pamrevlumab. Obviously, you have studies in IPF, in pancreatic cancer, now DMD, or plan to start the non-ambulatory DMD pretty soon. So can you -- I guess, just maybe on IPF here because I think this is the one that gets a lot of attention for the drug itself. You're going to have these 2 different studies. Obviously, COVID is an issue here for these patients. But can you kind of give us an idea of what you're really hoping to see from that Phase III that would really kind of reinforce confidence that it's maybe a particular endpoint that you think is really most important and kind of what extensive improvement and maybe kind of your plans for the readout in trials?

Enrique A. Conterno

CEO & Director

Yes. So clearly, what we -- the best example, what we expected, we want to replicate the studies -- basically the results that we saw in Phase II. They showed a very significant affect size. When it comes to the FDA, I think the primary endpoint is forced viral capacity. So -- and the Phase II results looked at that and a very significant impact in that. Keep in mind that in the case of pamrevlumab, not only do we have great results when it comes to forced vital capacity, but also we were able to show through imaging, basically really improvements when it comes to fibrosis. So not only is the biology, really promising here, but clearly, we have clinical data in Phase II that is quite impressive. And we made literally very few changes in the Phase III program. So we feel that the program is -- the likelihood of technical success, we believe, is very high.

We are trying to make sure that we execute as well as we can. COVID has been a pretty significant challenge when it comes to enrollment in these trials, just given the vulnerability of these patients. As we see now with the failure of the Galapagos trial, that has opened up a number of additional sites for us to be able to recruit sites in the past we did not have full access to. So we've already started that process contacting, and we've already added a number of sites. But also patients that were enrolled in those trials that might be eligible or could be eligible to enroll in the IPF, the ZEPHYRUS trials for pamrevlumab.

So that's probably an opportunity for us to accelerate the enrollment. We've also commented on our expansion of sites throughout the world, but also geographically, including China. So we've basically kind of pulled a number of levers to basically improve enrollment, and we're seeing some of that.

Brendan Mychal Smith

Cowen and Company, LLC, Research Division

Okay. Great. I think we're right up against time. And last questions from you, Yaron?

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

No. I think that warps it up. So Enrique and Mike, thanks so much for joining us. We really appreciate it.

Enrique A. Conterno

CEO & Director

Thank you very much, Yaron and Brendan.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division

Absolutely. Stay safe, and we'll be in touch.

Enrique A. Conterno

CEO & Director

Bye-bye.

Yaron Benjamin Werber

Cowen and Company, LLC, Research Division Thank you.

FibroGen Provides Additional Information on Roxadustat

Company Continues to be Confident in the Benefit / Risk Profile of Roxadustat

Company to Host Investor Call Today at 5:00 p.m. Eastern Time (2:00 p.m. Pacific Time)

SAN FRANCISCO, April 06, 2021 (GLOBE NEWSWIRE) -- FibroGen, Inc. (Nasdaq: FGEN) (the "Company") today provided clarification of certain prior disclosures of U.S. primary cardiovascular safety analyses from the roxadustat Phase 3 program for the treatment of anemia of chronic kidney disease ("CKD").

"As members of senior management were preparing for the upcoming FDA Advisory Committee meeting, we became aware that the primary cardiovascular safety analyses included post-hoc changes to the stratification factors," said Enrique Conterno, Chief Executive Officer, FibroGen. "While all of the analyses set forth below, including the differences in the stratification factors, were included in the NDA, we promptly decided to clarify this issue with the FDA and communicate with the scientific and investment communities."

Mr. Conterno continued, "It is important to emphasize that this does not impact our conclusion regarding the comparability, with respect to cardiovascular safety, of roxadustat to epoetin-alfa in dialysis-dependent (DD) patients and to placebo in non-dialysis dependent (NDD) patients. We continue to have confidence in roxadustat's benefit risk profile."

FibroGen continues to prepare for the FDA Advisory Committee meeting and will work closely with the FDA to bring this important new treatment to patients living with anemia of CKD.

There is no change in the underlying roxadustat data, or to the efficacy analyses from the Phase 3 program. The Company has begun a comprehensive internal review to ensure such issues do not occur in the future.

Pooled Cardiovascular Safety Data

As previously disclosed, the Company agreed with the FDA in the pre-NDA meeting that the primary analysis in non-dialysis would be ITT (intention to treat with long-term follow up) and in dialysis would be OT-7 (on-treatment plus 7 days). MACE, a composite endpoint of all-cause mortality, stroke, and myocardial infarction, was the primary safety endpoint agreed on with the FDA.

The table below describes the cardiovascular safety results using the post-hoc stratification factors reported at the American Society of Nephrology conference in November 2019, as well as the analyses with the prespecified stratification factors which have not been previously publicly reported.

	Analyses with post-hoc stratification factors	Analyses with pre-specified stratification factors
	HR (95% Confidence Interval)	HR (95% Confidence Interval)
Non Dialysis (OLYM	IPUS, ANDES, ALPS N=4,270); ITT	
MACE	1.08 (0.94, 1.24)	1.10 (0.96, 1.27)
MACE+	1.04 (0.91, 1.18)	1.07 (0.94, 1.21)
ACM	1.06 (0.91, 1.23)	1.08 (0.93, 1.26)
Dialysis Dependent (HIMALAYAS, SIERRAS, ROCKIES N=3,880); OT-7		
MACE	0.96 (0.82, 1.13)	1.02 (0.88, 1.20)
MACE+	0.86 (0.74, 0.98)	0.91 (0.80, 1.05)
ACM	0.96 (0.79, 1.17)	1.02 (0.84, 1.23)
Incident Dialys	is (N=1,526); OT-7	
MACE	0.70 (0.51, 0.96)	0.82 (0.60, 1.11)
MACE+	0.66 (0.50, 0.89)	0.78 (0.59, 1.02)

ACM 0.76 (0.52, 1.11) 0.82 (0.57, 1.18)

ITT: intention to treat with long-term follow up

OT-7: on-treatment plus 7 days

Major Adverse Cardiovascular Event (MACE): a composite endpoint of all-cause mortality, stroke, and myocardial infarction.

(MACE+): in addition to the components in MACE, includes hospitalization due to heart failure or unstable angina.

(ACM): all-cause mortality.

As reflected in the table, the analyses with the pre-specified stratification factors result in higher hazard ratios (point estimates of relative risk) and 95% confidence intervals. For MACE+ in dialysis and for MACE and MACE+ in incident dialysis, the 95% confidence intervals include 1.0. While these hazard ratios remain below 1.0, based on these analyses we cannot conclude that roxadustat reduces the risk of (or is superior to) MACE+ in dialysis, and MACE and MACE+ in incident dialysis compared to epoetin-alfa.

These analyses do not change the Company's assessment that roxadustat is comparable to placebo in non-dialysis dependent patients and to epoetin-alfa in dialysis dependent patients using MACE to measure cardiovascular safety.

As previously announced, roxadustat has been launched in China and Japan for the treatment of anemia of CKD in both NDD and DD adult patients. These approvals were based on different studies conducted in the relevant geographies. In Europe, the Marketing Authorization Application for roxadustat for the treatment of anemia of CKD in patients both on dialysis and not on dialysis was filed by FibroGen's partner Astellas and accepted by the European Medicines Agency for review in May 2020.

Conference Call and Webcast Details

FibroGen will host a conference call and webcast today, April 6, 2021, at 5:00 pm Eastern Time (2:00 p.m. Pacific Time) to discuss this matter. Interested parties may access a live audio webcast of the conference call via the FibroGen website at https://fibrogen.gcs-web.com/events-and-presentations/events. It is recommended that listeners access the website 15 minutes prior to the start of the call to download and install any necessary audio software.

Dial-In Information

Live (U.S./Canada): (877) 658-9081 Live (International): (602) 563-8732 Confirmation number: 5297733

A replay of the webcast and investor presentation will be available shortly after the call for a period of 30 days. To access the replay, please dial (855) 859-2056 (domestic) or (404) 537-3406 (international), and use passcode 5297733.

About Anemia of CKD

Chronic kidney disease (CKD) is generally a progressive disease characterized by gradual loss of kidney function that may eventually lead to kidney failure or end stage renal disease, requiring dialysis or kidney transplant. CKD is estimated to occur in approximately 10-12% of adults worldwide and is predicted to become the fifth most common cause of premature death globally by 2040.

Anemia, a serious medical condition in which patients have insufficient red blood cells and low levels of hemoglobin, is a common early complication of CKD, affecting approximately 20% of CKD patients. Anemia of CKD is associated with an increased risk of hospitalization, cardiovascular complications, and death, and can also cause significant fatigue, cognitive dysfunction and reduced quality of life. Blood transfusions are used for treating severe anemia, however, they may reduce a patient's opportunity for kidney transplant and can increase the risk of infection and/or complications such as heart failure and allergic reactions.

About Roxadustat

Roxadustat, an oral medicine, is the first in a new class of medicines, HIF-PH inhibitors that promote erythropoiesis, or red blood cell production, through increased endogenous production of erythropoietin; improved iron absorption and mobilization; and downregulation of hepcidin. Roxadustat is also in clinical development for anemia associated with myelodysplastic syndromes (MDS) and for chemotherapy-induced anemia (CIA).

Roxadustat is approved in China, Japan, and Chile for the treatment of anemia of CKD in adult patients on dialysis (DD) and not on dialysis (NDD). In Europe, the Marketing Authorization Application for roxadustat for the

treatment of anemia of CKD in patients both on dialysis and not on dialysis was filed by our partner Astellas and accepted by the sarched by

Astellas and FibroGen are collaborating on the development and commercialization of roxadustat for the potential treatment of anemia in territories including Japan, Europe, Turkey, Russia and the Commonwealth of Independent States, the Middle East, and South Africa. FibroGen and AstraZeneca are collaborating on the development and commercialization of roxadustat for the potential treatment of anemia in the U.S., China, other markets in the Americas, in Australia/New Zealand, and Southeast Asia.

About FibroGen

FibroGen, Inc. is a biopharmaceutical company committed to discovering, developing, and commercializing a pipeline of first-in-class therapeutics. The Company applies its pioneering expertise in hypoxia-inducible factor (HIF) and connective tissue growth factor (CTGF) biology to advance innovative medicines for the treatment of unmet needs. The Company is currently developing and commercializing roxadustat, an oral small molecule inhibitor of HIF prolyl hydroxylase activity, for anemia associated with chronic kidney disease (CKD). Roxadustat is also in clinical development for anemia associated with myelodysplastic syndromes (MDS) and for chemotherapy-induced anemia (CIA). Pamrevlumab, an anti-CTGF human monoclonal antibody, is in clinical development for the treatment of locally advanced unresectable pancreatic cancer (LAPC), Duchenne muscular dystrophy (DMD), and idiopathic pulmonary fibrosis (IPF). For more information, please visit www.fibrogen.com.

Forward Looking Statements

This release contains forward-looking statements regarding the Company's prospects, including statements regarding the safety and efficacy profile of our product candidates and regulatory results, strategy and interactions, including those of our partners. Forward-looking statements include, but are not limited to, statements about our plans, objectives, representations and contentions and are not historical facts and typically are identified by use of terms such as "may," "will", "should," "on track," "could," "expect," "plan," "anticipate," "believe," "estimate," "predict," "potential," "continue" and similar words, although some forward-looking statements are expressed differently. Our actual results may differ materially from those indicated in these forward-looking statements due to risks and uncertainties related to the continued progress and timing of our various programs, including the enrollment and results from ongoing and potential future clinical trials, and other matters that are described in our Annual Report on Form 10-K for the fiscal year ended December 31, 2020 filed with the Securities and Exchange Commission (SEC), and the risk factors set forth therein, including without limitation, risks related to obtaining regulatory approval and the planned FDA Advisory Committee meeting. Investors are cautioned not to place undue reliance on these forward-looking statements, which speak only as of the date of this release, and we undertake no obligation to update any forward-looking statement in this press release, except as required by law.

Presentation

Operator

Good day, and thank you for standing by. Welcome to the FibroGen Provides Roxadustat Update Call. [Operator Instructions] And please be advised that today's conference is being recorded. [Operator Instructions] I would now like to hand the conference to your speaker today, Michael Tung. Please go ahead.

Michael Tung

Investor Relations Executive

Thank you, Victor. Good afternoon, everyone. I'm Michael Tung, Vice President of Corporate Strategy and Investor Relations at FibroGen. Joining me on today's call are Enrique Conterno, our Chief Executive Officer; and Dr. Mark Eisner, our Chief Medical Officer. Format for today's call includes prepared remarks from Enrique and Mark. After which, we will open up the call for Q&A.

I would like to remind you that remarks made on today's call include forward-looking statements about FibroGen. Such statements may include, but are not limited to, statements regarding our collaboration with AstraZeneca and Astellas; results of clinical trials; our regulatory strategies and potential regulatory results; commercial results and results of operations; plans and strategy related to our business; and the planned FDA Advisory Committee Meeting and other anticipated FDA interactions. Each forward-looking statement is subject to risks and uncertainties that could cause actual results and events to differ materially from those anticipated in that statement. A more complete description of these and other material risks can be found in FibroGen's filings with the SEC, including our most recent Form 10-K.

FibroGen does not undertake any obligation to update publicly any forward-looking statements, whether as a result of new information, future events or otherwise. The press release reporting our business update and a webcast of today's conference call can be found on the Investors section of FibroGen's website at www.fibrogen.com. And with that, I'd like to turn the call over to Enrique Conterno, our CEO. Enrique?

Enrique A. Conterno

CEO & Director

Thank you, Mike. Good afternoon, and thank you all for joining us on such short notice. As you saw in today's press release, FibroGen is clarifying certain prior disclosures of U.S. primary cardiovascular safety analysis from the roxadustat Phase III program for the treatment of anemia of chronic kidney disease.

Let me explain more. The primary cardiovascular safety analysis included post-hoc changes to the stratification factors. The fact that this analysis included post-hoc changes to the stratification factors recently came to the attention of members of our senior management team, including myself, during our preparation for the upcoming FDA Advisory Committee meeting.

Before I continue, it is important to emphasize that there is no change in the underlying roxadustat data or to the efficacy analysis from the Phase III program.

Our conclusion regarding the comparability with respect to cardiovascular safety of roxadustat to epoetinalfa in dialysis-dependent patients and to placebo in nondialysis-dependent patients is not impacted. So let me be very clear. We continue to have confidence in roxadustat's benefit risk profile, and we're committed to working closely with the FDA to bring this important new treatment to patients living with anemia of CKD.

Nevertheless, we're taking this very seriously and promptly decided to clarify this issue with the FDA as well as communicate with the scientific and investment communities. We met with the FDA late last week. While all of the analysis set forth in the table provided today, including the differences in the stratification factors, were included in the NDA, we had a meeting with the FDA to ensure that it was clear. It was a

productive discussion, and we agreed to continue our discussion with regards to the advisory committee meeting. The team continues to prepare for this meeting.

Although this hasn't changed our confidence in roxadustat's benefit risk profile, and we believe this was limited to this particular set of analysis, we still want to understand how this happened. To that end, we have since begun a comprehensive internal review to ensure this doesn't occur in the future. This review is in its early stages. I don't have any additional details to share at this time.

I'll now turn it over to Mark Eisner, our Chief Medical Officer. Mark?

Mark Eisner

Chief Medical Officer

Thanks, Enrique. The press release the company issued today includes a table that describes the cardiovascular safety results using the post-hoc stratification factors reported at the American Society of Nephrology Conference in November 2019 as well as the analysis with the prespecified stratification factors which have not been previously publicly reported. This table is shown on the slide here, too.

As previously disclosed, the company agreed with the FDA in our pre-NDA meeting that the primary analysis in nondialysis would be ITT, or intention to treat, with long-term follow-up and in dialysis would be OT7, or on-treatment plus 7 days. MACE, a composite endpoint of all-cause mortality, stroke and myocardial infarction was the primary safety endpoint agreed on with the FDA. As you can see on this slide, the analysis with the prespecified stratification factors result in higher hazard ratios, point estimates of relative risk and 95% confidence intervals.

For MACE+ in dialysis and for MACE and MACE+ in incident dialysis, the 95% confidence intervals include 1. While these hazard ratios remain below 1, based on these analyses, we cannot conclude that roxadustat reduces the risk of or superior to MACE+ in dialysis and MACE and MACE+ in incident dialysis compared to epoetin-alfa. Importantly, these analyses do not change the company's assessment that roxadustat is comparable to placebo in nondialysis-dependent patients and to epoetin-alfa in dialysis-dependent patients using MACE to measure cardiovascular safety.

We have provided clarification, too, and we'll continue to work closely with the FDA, as Enrique mentioned at the start of today's call. I'd echo his comments that our recent discussion was a productive one, and our team remains focused on preparing for the upcoming Advisory Committee meeting.

Before I pass it back to Enrique, I'd also like to briefly touch on how this relates to our other launches for roxadustat. As previously announced, roxadustat has been launched in China and Japan for treatment of anemia of CKD in both NDD and DD adult patients. These approvals were based on different studies conducted in the relevant geographies. As such, we do not expect there to be an impact in China or Japan, where the product has already been launched.

And in Europe, the marketing authorization application for roxadustat for the treatment of anemia of CKD in patients both on dialysis and not on dialysis was filed by FibroGen's partner, Astellas, and accepted by the European Medicines Agency for review in May 2020. Based on our discussions with Astellas, we don't expect there to be an impact in Europe where the filing is currently under review.

With that, I'll turn it back over to Enrique for some closing remarks.

Enrique A. Conterno

CEO & Director

Thank you, Mark. I want to reinforce that we continue to have confidence in the roxadustat data and the safety and efficacy profile demonstrated in the Phase III program. In the U.S., we look forward to discussing the data in the upcoming Advisory Committee meeting and ultimately, to bringing this important new medicine to patients living with CKD anemia.

I hope it's clear that this team is focused on acting with full transparency and we're determined to ensure that something like this doesn't happen again. The senior management team is treating this with an utmost seriousness, as I emphasized at the start of today's call.

I'm not going to let this overshadow the incredible work that we have put into this treatment or the incredible work we are doing across the company to harness groundbreaking science to meet medical needs. Our 3 areas of focus, which you heard me talk about before, do not change as a result. First, we continue to be focused on ensuring the regulatory and commercial success of roxadustat, as we've emphasized throughout today's call. Second, we continue to be focused on accelerating the development of pamrevlumab in 3 high-value indications: locally advanced and resectable pancreatic cancer, Duchenne muscular dystrophy and idiopathic pulmonary fibrosis. And third, we continue to be focused on strengthening our research productivity based on leveraging our medical leadership position in both HIF and CTGF biology and accessing external innovation.

So what you're hearing from me is that while this internal review is ongoing, we'll continue to execute our business priorities to develop and deliver first-in-class medicines for the treatment of chronic and life-threatening conditions.

Now we will open the call for Q&A, keeping in mind that we will be limited in our ability to comment much beyond the detail we shared today.

Question and Answer

Operator

[Operator Instructions] Our first question will come from the line of Michael Yee from Jefferies.

[Technical Difficulty]

And our next question comes from the line of Geoffrey Porges with SVB Leerink.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

My questions relate to what was agreed on with the FDA. Enrique, first of all, did you present to the FDA previously in the original application, the post-hoc stratification based analysis or the prespecified stratification analysis? So to be clear, is this an issue of what was presented at ASN being inconsistent with what was provided to the agency? Or have you had to present new statistical -- your new statistical results to the agency?

And then secondly, it's fairly clear now that in the non-dialysis population, you have 2-point estimates that are above 1 in non-dialysis and the upper bounds of the hazard ratio -- of the confidence intervals above 1.25. Can you be clear whether the upper bound of the confidence intervals that was pre-agreed with the agency was 1.25 or 1.3 for noninferiority?

And then lastly, Do you still believe that you are non-inferior to placebo in the non-dialysis setting?

Enrique A. Conterno

CEO & Director

Yes. Very good. Thank you very much for your question, Geoff. I'll try to provide some initial answers, maybe to the last 2 parts of your question, and then I'm going to have Mark Eisner complement that.

Yes, we continue to believe that in non-dialysis, we basically show comparability relative to placebo. With regards to the 1 point to any measures of excess risk, you mentioned 1.25 or 1.3, I think I said in a number of different occasions that we do not have a pre-agreed non-inferiority margin with the FDA. That has always been a -- what we share as a review issue, an issue that needs to be looked at when the FDA looks at the totality of the efficacy and safety data for roxadustat.

When it comes to the NDA, we did submit a number of different analyses, including both sets of this analysis that we are sharing with you with the FDA. I'm going to Mark to maybe provide a little more context to that.

Mark Eisner

Chief Medical Officer

Yes. Thank you, Enrique. So yes, building on what you stated, we had previously included in the new drug application, both the analysis for the prespecified stratification factors and the post notification factors. And we also had explained the changes to the stratification factors in the new drug application. We met with FDA last week just to make sure that it was clear which analyses used which factors, prespecified and post-hoc, and the agency appreciated the clarification. It was a very cordial and collaborative meeting, and we agreed to continue working toward the Advisory Committee.

Operator

[Operator Instructions] Next question comes from the line of Difei Yang with Mizuho.

Difei Yang

Mizuho Securities USA LLC, Research Division

Just a couple. The first one is on have you been formally notified on the Adcom meeting, and if there is a schedule set up for that? And secondarily with regards to the internal review, is that an internal review of FibroGen's process? Or is that part of a NDA approval? So meaning that the FDA will have to buy into the conclusions and they think there's enough control this will not happen in the future.

Enrique A. Conterno

CEO & Director

Yes. Thank you, Difei. Let me answer the second part of your question. The internal review I was referencing is an internal FibroGen process. As it relates to the Adcom and the timing, we expect to hear from the FDA in the coming weeks on the timing of the Adcom.

As a reminder, we do not have an active PDUFA date at this time. And it would be, of course, consistent with prior practice for the FDA to make a decision on roxadustat NDA sometime after the Adcom. So we will be updating all of you once we learn more.

Operator

Your next guestion comes from the line of Michael Yee with Jefferies.

Michael Jonathan Yee

Jefferies LLC, Research Division

Hey guys, can you hear me okay now?

Enrique A. Conterno

CEO & Director

Yes.

Michael Jonathan Yee

Jefferies LLC, Research Division

Great. Yes. I'm not sure what happened, going on there. I have 2 questions related to dialysis. I just wanted to confirm that you are seeing that you cannot say you're superior in incident dialysis and get your view as to why you don't think that changes the overall benefit risk of the equation or perhaps even peak sales, maybe make a comment about that incident.

And then related to that, going again to your chart where you talk about dialysis. You showed total dialysis, you showed incident dialysis, but you don't show stable dialysis, which is the other half of the population. Can you maybe just comfort us or give some clarity as to what that data shows and why you don't think that's relevant.

Enrique A. Conterno

CEO & Director

Let us maybe try to answer all of those questions, maybe not the same order that you asked them. But clearly, our conclusions when it comes, as I mentioned, to -- in NDD and DD that we're comparable to placebo in NDD and comparable in DD to EPO have not changed a from a safety perspective. I think that's a critically important message.

When it comes to incident dialysis, the numbers continue to be quite positive. But at this stage, I think for MACE, it crosses 1. So we can no longer make the conclusion that we have a statistically superior result when it comes to MACE relative to EPO in this specific population.

Michael, this goes all the way to before my time. But FibroGen has been pretty clear over time that the fairest setting to be able to compare roxa relative to EPO is in the incident dialysis population. Those patients that are new to dialysis, in most cases, new to treatment, to look at how do they basically respond in each one of these treatments. And of course, over time, those incident dialysis patients become stable dialysis. So the incident dialysis patients here reflect -- yes, patients that were initiated within 4

months. But in -- those patients continued treatment, either on roxadustat or EPO, for some time through the conclusion of this trial.

When it comes to stable dialysis, that's something today, I think our focus has been, we have not published publicly data on stable dialysis today, I think our focus was really on providing an update on the data that we had publicly presented in the past. Clearly, this is something, when it comes to stable dialysis, we hear everyone that they want to see more data, and that's something we'll discuss with our partners. I'm going to ask Mark Eisner if he has something to add here.

Mark Eisner

Chief Medical Officer

Yes. Thanks, Enrique. I mean, the main thing I would add is that I would agree that the incident dialysis population is a very good population to look at the safety and efficacy of roxadustat because these patients are new to dialysis, they're just being started on the drug, and then they can transition onto dialysis with their anemia corrected. So that's point 1.

Point 2 is that the incident dialysis point estimates are still below 1. And the overall analysis are consistent with comparable safety to placebo in the NDD population and to ESA in the dialysis-dependent population. And overall, we feel very good about the overall benefit-risk profile of the drug.

Operator

Our next question comes from the line of Paul Choi with Goldman Sachs.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

I was wondering, first, if you could perhaps elaborate a little more on the stratification factors and which one, in terms of the change in between the post-hoc and the prespecified had the biggest impact with regard to the change to the point estimates and the confidence intervals? And then I have a follow-up.

Enrique A. Conterno

CEO & Director

Yes. I'm going to have Mark answer that question. We -- just to -- we have not conducted a specific analysis looking at each specific factor. So we looked at the combination of the factors, but I'll allow Mark to answer that question.

Mark Eisner

Chief Medical Officer

Yes. Thanks for the question. So the bottom line is that there were some post-hoc changes to the stratification factors. But to give you a little more detail, the cut point for GFR based on hemoglobin and definition of geographic region were changed after unblinding. And then in the dialysis-dependent population, there were some additional variables of sex, race and body mass index that were added. So this gives you kind of a sense for the types of changes that we're talking about.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Okay. And that clarification is helpful. My follow-up question is just with regard to the magnitude of the changes, specifically with regard to the incident dialysis population, which were -- which are larger than the changes to the NDD and DD population. And I guess here, just as you think about the comparability to the control arms here, I guess as you think about the incremental changes, especially to the upper ends of the confidence interval, I guess how -- what would your suggestion or what is the guidance here with regard to just thinking about the safety profile, given that the confidence intervals now are above 1 here.

Mark Eisner

Chief Medical Officer

So in the incident dialysis population, you're correct that the upper bounds for MACE and MACE+ now at 1. And for the dialysis-dependent population for MACE+, that's also true. But still, the overall results are very comparable in the NDD population to -- for roxadustat to placebo and in the DD and the incident dialysis subpopulation, comparable to ESA's in terms of cardiovascular safety. So overall, we continue to believe that the benefit risk profile of roxadustat is favorable.

Operator

And our next question comes from the line of Annabel Samimy with Stifel.

Annabel Eva Samimy

Stifel, Nicolaus & Company, Incorporated, Research Division

Most of them have been answered at this point. But I just want a little bit of clarification. First, when this issue came to your attention, was it something that you identified independently or was it brought to your attention by the FDA? Because I guess that changes maybe the tone of your conversations with the FDA.

And then the second question I had with regards to the NDD population. Ultimately, do you believe that this -- if you have to recommunicate this to the physician population, does this change their perception of the safety with regard to whether they might want to use it in NDD population. And ultimately, I guess, that goes back to the initial question, which was does this is change your peak potential here?

Enrique A. Conterno

CEO & Director

Yes. Thank you very much for your question. No, we were not informed of this by the FDA. I think the way this happen, as members of our senior management team were preparing for the upcoming FDA Adcom meeting, we became aware that the primary cardiovascular safety analysis including post-hoc changes to the stratification factors. And upon becoming aware, we promptly decided to clarify this issue with the FDA and communicate with the scientific and investment community. So that's how we should think about how this was uncovered. I'm going to allow now Mark to answer the second part of your question.

Mark Eisner

Chief Medical Officer

Thanks, Enrique. So you asked about specifically the non-dialysis dependent population and how we would communicate that to the physician community. And I think we can clearly state that the results with the prespecified stratification factors continue to support comparable cardiovascular safety between roxadustat and placebo and a positive benefit risk profile. So although we're now presenting you this information with the prespecified stratification factors, it's a very consistent message to the one that was communicated with the post-hoc stratification factors.

Operator

And our next question comes from the line of Jason Gerberry, Bank of America.

Unknown Analyst

This is [Claudia Herman] on for Jason. So to that point about the differences in MACE looking pretty minor, but in incident dialysis, it varies more presumably because of fewer events. Can you comment on the magnitude of the MACE components of stroke and MI, how those change in NDD? Is the lower end of the confidence interval still below 1?

Mark Eisner

Chief Medical Officer

So thanks for the question. As we've reiterated before, the primary analysis for cardiovascular safety is actually MACE in the nondialysis population and in the dialysis-dependent population, and we previously agreed that with FDA. And we also agreed in the NDD population with the intention to treat analysis in the OT7 approach for the dialysis-dependent analysis. So the primary safety is going to be based on the point

estimate and the 95% confidence interval for MACE. So that's the most important thing to emphasize here.

And we will be presenting the totality of the evidence at our Advisory Committee, including all of the other analysis that have been done to provide the most comprehensive picture of the benefit risk. And I think that's the most important thing to emphasize is the emphasis on MACE.

Unknown Analyst

Okay. And then when you say that the FDA agreed to ITT analysis for NDD and on-treatment analysis for DD, did they -- did the FDA themselves suggest this analysis? Or was it proposed by FibroGen? And do you think the FDA will also focus on the alternate analysis in each indication?

Mark Eisner

Chief Medical Officer

If I understand your question correctly, the question -- is the question about what stratification factors were agreed with FDA? I kind of missed it.

Unknown Analyst

It is on the ITT analysis for NDD and on-treatment analysis for DD. Did the FDA ask for that specifically? Or was it proposed by FibroGen? And do you think that the FDA will also look at on-treatment analysis for NDD and ITT analysis for DD?

Mark Eisner

Chief Medical Officer

I see your question. Apologies for not having it straight the first time. The FDA and FibroGen had a discussion at the pre-NDA meeting about the most appropriate analysis methodology. And both FibroGen and FDA agreed on the ITT analysis of MACE as primary for the non-dialysis population and the OT7 analysis for the dialysis-dependent population. So that was an agreement that was made, and it was thought to be, from both sides, the most appropriate way of presenting the data.

Now the other point I alluded to earlier about the totality of evidence, we clearly are going to present other analyses, for example, with the subset with EGFR greater than 10, ITT analysis with a landmark at 12 months, other sets of analyses that can be informative. And we think together, this will support the positive benefit-risk profile of roxadustat.

Operator

Your next guestion comes from the line of Yaron Werber with Cowen.

Brendan Mychal Smith

Cowen and Company, LLC, Research Division

This is Brendan on for Yaron. A lot of good ones here so far. So just a couple of quick ones here. Building on an earlier question about the stable dialysis patients, I just wanted to kind of check and narrow down. Do you have plans here or will you release data from the stable dialysis patients specifically to kind of offer this comparison versus full incident patients? And then I know you also mentioned that you don't really expect any impact to the China, Japan launches or the MAA filing. But have you had or maybe plan to have any conversations with EMA, for example?

Enrique A. Conterno

CEO & Director

Yes. The conversation in Europe really is led by Astellas. Astellas is the sponsor of the European submission. Our understanding, based on the discussion with Astellas, is that they don't expect this to impact the review. And I'm going to let Mark answer the first part of your question.

Mark Eisner

Chief Medical Officer

So the question again is about the stable dialysis data. And we, today, are really focusing on providing additional clarifications on scientific disclosures that have been already made, so we wanted to really focus on that. We do understand the SDD data are relevant for the investor and scientific community. And we are talking with our partners about the best way in which to present that information.

Enrique A. Conterno

CEO & Director

So the answer is yes, we intend to share that information in the future. Clearly, it is likely that, that information will be shared at the Adcom as well.

Operator

Your next question comes from the line of Andy Hsieh with William Blair.

Tsan-Yu Hsieh

William Blair & Company L.L.C., Research Division

So I have one kind of a follow-up to those question. So you mentioned that this discrepancy was discovered during the Adcom preparation. I'm just wondering is there any difference in the Adcom preparation last year versus this year that enabled the discovery of this discrepancy? And in your last week's discussion with the FDA, would you be able to share with us which division of the FDA you were speaking with? Was it the original NDA, the nonmalignant hematology division or the Adcom cardio-renal division?

Enrique A. Conterno

CEO & Director

Yes. I'm going to let Mark answer those 2 questions.

Mark Eisner

Chief Medical Officer

So in terms of your first part of your question, as Enrique said earlier, while we were reviewing the information, the NDA for preparing for the Adcom, it became clear that at the way the analysis have been done in terms of the pre versus post-hoc stratification factors has not been entirely clear. And recall that Enrique joined the company about 12 months ago, I joined about 4 months ago. So partly, this reflects fresh eyes on the same information. And we had a very good discussion with FDA, productive discussion about this, and they appreciated the clarifications.

In terms of the FDA discussion, specifically it was with Division of Hematology, which is conducting the review, and senior leadership from the Office of Cardiovascular, Hematology, Endocrinology and Nephrology (sic) [Office of Cardiology, Hematology, Endocrinology and Nephrology], OCHEN. So it's kind of a combined discussion.

Tsan-Yu Hsieh

William Blair & Company L.L.C., Research Division

And one more follow-up, if I may. Obviously, the data was presented at a conference in 2019. Is there any strategy in terms of messaging to kind of [prove] that? And also related to one of the data presentations that you made last year at ASN, I believe one poster was -- talked about if the hemoglobin level beyond 10, you do see kind of a dose response in MACE and hemoglobin. Did this analysis, post versus pre, change that observation?

Mark Eisner

Chief Medical Officer

So first of all, in terms of clarifying prior presentations, in a particular publication of the pooled incident dialysis data that's come out in Kidney International, we are contacting leadership of ASN and the editorial

-- editor, rather, of Kidney International to find the best way forward to provide clarification on those publications and communications. In terms of your specific question, that's not something we specifically looked at yet, but it's part of our overall review.

Operator

And our next question comes from the line of Edwin Zhang with H.C. Wainright.

Xiaodong Zhang

H.C. Wainwright & Co, LLC, Research Division

Sorry, I'm late for the call. I apologize if my questions have been asked. I have two first. For the prespecified stratification factor, is this -- I know this is a new analysis. Is this the one that FDA and the headcount going to use?

Mark Eisner

Chief Medical Officer

So good question. We believe that the prespecified -- the analysis with the prespecified stratification factors is the primary analysis, which should be emphasized when it comes to the analysis of MACE in both NDD and DD populations. That said, it's always been the plan to provide a variety of sensitivity analyses and different approaches to look at the cardiovascular safety data that's supportive. So I do think that the Advisory Committee, during the FDA's review, they will take a totality of the evidence approach that takes a number of different analyses into account. At the end of the day, we do believe that the benefit/risk profile of roxadustat is positive and that the review will likely conclude that.

Xiaodong Zhang

H.C. Wainwright & Co, LLC, Research Division

Okay. I just read through your press release. Looking at the table, I see the incident dialysis. Correct me if I'm wrong. Based on the new analysis, I guess, the superiority we had before in incident dialysis is no longer valid. Is that right?

Enrique A. Conterno

CEO & Director

Yes. Yes, we mentioned that. That is correct. Based on the prespecified stratification factors, we can no longer conclude superiority in that side.

Operator

Thank you. I would now like to turn the call back over to Enrique for any closing remarks.

Enrique A. Conterno

CEO & Director

I want to thank everyone for coming and joining us today at this conference call in such short notice. We remain focused on getting roxadustat through the approval at the FDA and look forward very much to presenting the full data at the Advisory Committee. Thank you very much to everyone for joining. Byebye.

Operator

Ladies and gentlemen, this concludes today's conference call. Thank you for participating, and you may now disconnect.

Operator

Good day, and welcome. Thank you for standing by. Welcome to the FibroGen First Quarter 2021 Financial Results Conference Call. [Operator Instructions] Please be advised that today's conference is being recorded. [Operator Instructions] I would now like to hand the conference over to your speaker for today, Mr. Michael Tung. Please go ahead.

Michael Tung

Investor Relations Executive

All right. Thank you, Erica, and good afternoon, everyone, and welcome to FibroGen's conference call for our fiscal 2021 first quarter. I'm Michael Tung, Vice President of Corporate Strategy and Investor Relations at FibroGen.

Joining me on today's call are Enrique Conterno, our Chief Executive Officer; Dr. Percy Carter, our Chief Scientific Officer; Pat Cotroneo, our Chief Financial Officer; Dr. Mark Eisner, our Chief Medical Officer; Thane Wettig, our Chief Commercial Officer; Chris Chung, our Senior Vice President of China Operations; and Dr. Elias Kouchakji, our Senior Vice President of Clinical Development, Drug Safety and Pharmacovigilance. Format for today's call includes prepared remarks from Enrique, after which we will open up the call for Q&A.

I'd like to remind you that remarks made on today's call may include forward-looking statements based on FibroGen's current expectations. Such statements may include, but are not limited to, statements regarding our collaboration with AstraZeneca and Astellas; financial guidance; the initiation, enrollment, design, conduct and results of clinical trials; our regulatory strategies and potential regulatory results; our research and development activities, commercialization and results of operations; risks, plans, market opportunity and strategy related to our business; the planned FDA Advisory Committee meeting and other anticipated FDA interactions; and certain other business matters.

Such forward-looking statements are subject to significant risks and uncertainties that could cause actual results and events to differ materially from those anticipated in such statements. For a discussion of these and other material risks and factors that could affect our future financial results and business, please refer to the disclosure in today's press release reporting our fiscal 2021 first quarter financial results and business update, our most recent Forms 10-K and 10-Q and reports that we may file on Form 8-K with the Securities and Exchange Commission.

All statements are made as of today, May 10, 2021, based on information currently available to us, and FibroGen does not undertake any obligation to update publicly any forward-looking statements whether as a result of new information, future events or otherwise, except as required by law. Today's press release reporting our fiscal 2021 first quarter financial results and business update and a webcast of today's conference call can be found in the Investors section of FibroGen's website at www.fibrogen.com.

With that, I would like to turn the call over to Enrique Conterno, our CEO. Enrique?

Enrique A. Conterno

CEO & Director

Thank you, Mike, and good afternoon, everyone, and welcome to our first quarter 2021 earnings call. Today, I would like to provide a high-level summary of the most important accomplishments and developments in recent months. Pat Cotroneo, our CFO, will then review the financials, after which we will open up the call for your questions.

I reiterate my assessment that FibroGen is uniquely positioned to create significant value for patients and shareholders by executing on the 3 areas of focus as shown on Slide 2: number one, ensuring regulatory and commercial success of roxadustat, a transformational medicine for the treatment of anemia, first, in patients with chronic kidney disease, but with significant potential for expansion to treatment of additional

indications; number two, accelerating the development of pamrevlumab in 3 indications with significant unmet

[Audio Gap]

advanced unresectable pancreatic cancer, Duchenne muscular dystrophy and idiopathic pulmonary fibrosis; and number three is strengthening research productivity by leveraging our leadership position both in hypoxia-inducible factor and connective tissue growth factor biology and by accessing external innovation. Today's call will include a review of roxadustat, our continued strong performance in China and our clinical trial programs.

Let us get started with the roxadustat U.S. New Drug Application, or NDA, review. In March, we announced that the FDA has decided to hold an Advisory Committee meeting for the roxadustat NDA. Our team remains focused on preparing for the upcoming Advisory Committee meeting, which is tentatively scheduled for July 15. In April, we made an announcement clarifying for the FDA and the medical and investment communities certain prior disclosures of primary cardiovascular safety analysis from the roxadustat Phase III program for the treatment of anemia in chronic kidney disease. Our meeting with the FDA was productive, and we have had further productive discussion with them regarding the outcome.

Importantly, this clarification does not impact our overall conclusions regarding the comparability with respect to cardiovascular safety of roxadustat to epoetin alfa in dialysis-dependent patients and to placebo in non-dialysis-dependent patients. As described on April 6, for the incident dialysis subgroup, based on the prespecified stratification factors, roxadustat is comparable but not superior to epoetin alfa with regards to cardiovascular safety. We look forward to publicly discussing the analysis of the cardiovascular safety data at the Advisory Committee in July.

We have reached out to key opinion leaders, primary investigators and medical journals to discuss this matter, and the discussions thus far have been productive and appreciated. We continue to progress our internal review expeditiously, and we'll communicate at the appropriate time. Importantly, we are putting controls in place to prevent this type of occurrence in the future. I want to reiterate that we continue to have confidence in the roxadustat data and in the safety and efficacy profile demonstrated in the Phase III program. FibroGen and AstraZeneca are committed to working together with the FDA to bring roxadustat to patients with anemia CKD in the U.S.

Our pre-commercial activities have continued. FibroGen recently presented additional analysis at the National Kidney Foundation Spring Clinical Meeting and the ISN World Congress of Nephrology, and there continues to be significant interest in roxadustat from the clinical community. Health care professional disease education activities are ongoing and expected to increase through the official launch. Our partner, AstraZeneca, has a comprehensive renal commercial presence in the U.S. and together, we are committed to make roxadustat available to as many CKD patients as quickly as possible.

In order to ensure patient access, AstraZeneca is leading the discussions with dialysis organizations and with payers who cover non-dialysis patients. We have submitted manuscripts covering the CKD anemia Phase III studies to peer-reviewed journals. As noted in Slide 3, 6 of these manuscripts have been published, encompassing both non-dialysis-dependent and dialysis-dependent data, and we expect additional publications of the Phase III data in the coming months.

Astellas recently reported their fiscal year 2020, which ended in the calendar year first quarter. They guided to total Evrenzo sales of approximately \$80 million for the fiscal year 2021, and this guidance includes Evrenzo sales in both Japan and Europe. In Europe, we continue to expect a midyear decision by the European Medicines Agency of the marketing authorization application for roxadustat for the treatment of anemia in adult dialysis and non-dialysis patients with chronic kidney disease.

Moving now to China on Slide 4. We're pleased to report total roxadustat net sales to distributors in China of \$43.5 million for the first quarter versus \$29.2 million in the fourth quarter of 2020. An increase in uptick continues to be driven by both an expansion in hospital listings and broad adoption within listed hospitals. Under the revised partnership structure, FibroGen reported \$15.4 million in China roxadustat net product revenue for the first quarter of 2021.

As we have previously disclosed, beginning the first quarter, a jointly owned distribution entity, or JDE, is responsible for selling roxadustat to distributors and will pay for AstraZeneca's commercialization efforts in China and AZ's portion of the profit share. Previously, FibroGen was responsible for these items. The JDE is expected to account for over 95% of overall China roxadustat sales volume going forward. The rest will continue to be conducted directly by FibroGen.

Hospital listings continue to be a key focus of our launch efforts. Notably, at the end of the first quarter, roxadustat was listed on hospitals that collectively represent approximately 74% of the CKD market opportunity in China. As you can see on Slide 5, interestingly, since the inclusion of roxadustat on the NRDL, the ESA market growth has accelerated. In fact, ESA revenue over the last 6 months have shown 21% growth over the same period of the prior year.

Moving to Slide 6. Roxadustat has expanded the anemia of CKD category over the past 14 months, which translates into roxadustat adding new patients to the anemia of CKD category. Combining this view of roxadustat uptake along with the growing ESA category as shown in the previous slide, it's evident that roxadustat is growing share in an expanded market, which is a great sign. Finally, as shown on Slide 7, roxadustat is the #1 branded treatment for anemia of CKD in China for each of the past 2 months with a 27% value share in the segment that includes all ESA products and roxadustat, currently the only HIF-PHI on the market.

We continue to see significant roxadustat utilization across a range of anemia of CKD patient populations. Approximately 65% of patients treated with roxadustat in China are on dialysis, covering hemodialysis and peritoneal dialysis, while the remaining 35% are not on dialysis. This broad utilization pattern bodes well for long-term success and provides critical learnings as we prepare to launch roxadustat in the U.S., Europe and in other countries. We look forward to keeping you updated as we advance our long-term goal of making roxadustat the standard of care in treating China's CKD anemia patients.

Moving now to our clinical development and starting with roxadustat. During the quarter, we completed enrollment of our Phase II chemotherapy-induced anemia, or CIA, trial. In ASPEN and DENALI, our 2 roxadustat Phase IIIb studies in CKD anemia patients conducted with U.S. dialysis organizations, many patients have transitioned now into the extension phase. We expect to present top line data at a future medical meeting.

Moving now to pamrevlumab. In March, we announced the initiation of LELANTOS-2, a Phase III randomized, double-blind, placebo-controlled trial of pamrevlumab in ambulatory patients with Duchenne muscular dystrophy. Pamrevlumab was recently granted Fast Track designation and Rare Pediatric Disease designation from the U.S. FDA for the treatment of DMD. We value this acknowledgment of the serious and life-threatening manifestations of this rare disease and support of our mission to provide pamrevlumab as a potential treatment option for DMD patients.

I will turn now the call over to our CFO, Pat Cotroneo, for the financial update. Pat?

Pat Cotroneo

Chief Financial Officer

Thank you, Enrique. As announced today, total revenue for the first quarter of 2021 was \$38.4 million as compared to \$24.4 million for the first quarter of 2020. The current quarter revenue consists of \$15.4 million in net product revenue for roxadustat sales in China, \$14.6 million in development revenue and \$8.5 million in drug product revenue for roxadustat bulk drug or active pharmaceutical ingredient.

For the same period, operating costs and expenses were \$108.9 million, and net loss was \$71.8 million or \$0.78 per basic and diluted share as compared to operating costs and expenses of \$105.5 million and a net loss of \$78.3 million or \$0.89 per basic and diluted share for the first quarter last year. Included in operating costs and expenses for the quarter ended March 31, 2021, was an aggregate noncash portion totaling \$25.1 million, of which \$19.4 million was a result of stock-based compensation expense as compared to an aggregate noncash portion of \$22.1 million, of which \$16.9 million was a result of stock-based compensation expense for the same period in the prior year.

At March 31, FibroGen had \$682.6 million in cash, cash equivalents, restricted time deposits, investments and receivables. As mentioned in our last call, we have made some changes in financial reporting. Starting this quarter, the jointly owned distribution entity between AstraZeneca and FibroGen, or the JDE, is responsible for selling roxadustat to distributors and pays for AZ's commercialization efforts in China and AZ's portion of the profit share. Previously, FibroGen was responsible for these items.

As of March 31, the JDE accounted for over 95% of overall China roxadustat sales volume, while the rest continues to be conducted directly by FibroGen. As such, under this new structure, FibroGen reported \$15.4 million in China roxadustat net product revenue for the first quarter of 2021 on a U.S. GAAP basis, which included FibroGen's revenue generated from our sales through the JDE as well as our direct sales in China. To provide context for the operating results of our roxadustat business in China, total roxadustat net sales, including sales through the JDE to its distributors and FibroGen China's direct sales to our distributors, was \$43.5 million for the first quarter of 2021.

Looking ahead at our broader financial picture, we have a total of \$245 million in potential milestones expected by the end of the year for anticipated U.S. and EU approvals and first commercial sale in the U.S. At this point in time, we have no changes in expectations in any of the anticipated milestones between now and year-end 2021. Based on our latest forecast data, we continue to estimate our 2021 ending balance of cash, cash equivalents, restricted time deposits, investments and receivables to be in the range of \$660 million to \$670 million assuming U.S. and EU roxadustat approval in 2021.

Thank you. And now -- I would now like to turn the call back over to Enrique.

Enrique A. Conterno

CEO & Director

In closing, this is an exciting time for FibroGen. Roxadustat continues to perform very well in China and is under regulatory review in the U.S., Europe and other geographies. Our team remains focused on preparing for the upcoming Advisory Committee meeting that is tentatively scheduled for July 15, and we look forward to presenting the roxadustat data in a public forum. Pamrevlumab is our wholly owned potential first-in-class new medicine in Phase III development in 3 indications with significant unmet medical need: locally advanced unresectable pancreatic cancer, Duchenne muscular dystrophy and idiopathic pulmonary fibrosis.

Finally, we continue to advance our research agenda. We're delivering on our unique scientific expertise, strengthening and broadening our internal capabilities, while also looking for external opportunities with the goal of expanding our pipeline of innovative drug candidates. As shown on Slide 8, we're in a strong financial position of roxadustat sales ramp-up with approximately \$682 million in cash and another \$245 million in anticipated roxadustat milestone payments expected during 2021.

I would like to take a moment and also welcome Tricia Stewart, who we recently appointed as Chief People Officer at FibroGen reporting to me. She comes most recently from Genentech and will be responsive for advancing our people and culture strategy. Looking forward, I believe we're positioned for success. Now I would like to turn the call back to the operator for questions. Erica?

Question and Answer

Operator

[Operator Instructions] Our first question comes from the line of Annabel Samimy.

Annabel Eva Samimy

Stifel, Nicolaus & Company, Incorporated, Research Division

I'm not sure if I missed the initial comments, but I was wondering if you could tell us, during the preparations for the AdCom, have you conducted analysis of any of the additional clinical benefits that were published or presented or claimed like reduced RBC transfusion efficacy regarding inflammatory status on hyper responders or better iron utilization? And can you feel comfortable that the data that you presented at those meetings are accurate? And then secondly, you had mentioned some critical learnings in China. Maybe you can highlight what those learnings are for us.

Enrique A. Conterno

CEO & Director

Very good. Let me turn the first -- your first question about roxadustat and the benefit risk profile to our CMO, Chief Medical Officer, Mark Eisner.

Mark Eisner

Chief Medical Officer

Yes. Thanks for the question. So yes, the answer to your question is, yes, we have confirmed the additional benefits in terms of hemoglobin increase from -- with roxadustat, reduction in red blood cell transfusions, roxadustat having benefit in patients with high CRP and who are functionally iron deficient. So we've been able to confirm all of those results, and that has not changed since our April 6 press release.

Enrique A. Conterno

CEO & Director

Very good. Clearly, I think when it comes to China, I think the results in China, I think, I would call nothing short of impressive and quite frankly, gives us a lot of confidence for how roxadustat is becoming a primary choice when it comes to treating anemia of CKD patients in China across the continuum of both DD and NDD. There are a number of learnings that we are capturing from China. One of them, I think I've mentioned in the past, was we've seen a faster-than-expected uptick, in particular, in the NDD segment. And what we basically see is basically also excellent feedback because it is -- when it comes to a launch, clearly, the first few quarters could be always impressive.

But now I think we have a string of quarters where we've seen continued growth quarter-on-quarter that basically reflects not just the overall benefit/risk profile of roxadustat that we've discussed, but also the feedback from health care professionals and patients in terms of what roxadustat is offering in the real world. So I think it's very -- honestly, we are very encouraged with that and the potential read-through of that to other markets.

Operator

Your next guestion comes from the line of Michael Yee.

Michael Jonathan Yee

Jefferies LLC, Research Division

We had 2 questions. The first was to the extent you can talk about maybe topics or relevant areas of interest that you think will be discussed or could be a focus for the panel, that would be great. Since it sounded like you've had good ongoing conversations and things, maybe you could shed some general light on how to think about that from an expectation standpoint. And the second was related, which was

that I know that it is being reviewed in terms of an AdCom from the cardiovascular renal group. Is that a separate group that you've had dialogue with? Or how does that play into things in terms of ongoing discussions?

Enrique A. Conterno

CEO & Director

Yes. I'm going to have Mark Eisner try to answer both of those questions, and I will complement as appropriately. Mark?

Mark Eisner

Chief Medical Officer

Yes. So thanks for the question. So yes, we have been having collaborative dialogue with the FDA about the Advisory Committee. I think both the agency and FibroGen and our partner, AstraZeneca, want to make sure that we have a very fulsome discussion at the Advisory Committee and give the Advisory Committee members the information they need to fully understand the program. In terms of the themes, I think I'd largely characterize it around the benefit/risk profile of roxadustat for patients with CKD anemia and just further explaining the safety and the efficacy of the medicine for NDD and DD populations and getting the input particularly from expert nephrologists who treat patients with CKD anemia. So that's kind of a broad answer, but that's where we are with the agency at the moment.

And in terms of you mentioned that this will be a cardiorenal drug advisory committee, which it is, and yes, we've had conversations both with the office -- at the office level with the cardiorenal -- it's actually [indiscernible] but includes cardio and renal and also with the benign hematology division. So we've had discussions at all those levels of FDA, including the various stakeholders for both disease areas.

Enrique A. Conterno

CEO & Director

Yes. I would just maybe add that I think our preparations when it comes to the AdCom, I think, are progressing well.

Michael Jonathan Yee

Jefferies LLC, Research Division

The reason I ask is because this is -- supposedly, we'll have renal or nephrology experts on there and you think that, that would be a positive, yes, because there would actually be experts on the panel rather than just people who are not familiar with that. Is that a fair statement?

Mark Eisner

Chief Medical Officer

I think it is important to have nephrology experts with the -- which I believe the FDA intends to have because they do treat patients with CKD anemia both in the NDD setting and dialysis setting. So they're in a very good position to understand the unique attributes of roxadustat and where the benefit/risk is going to be positive. So yes, I think it's going to be really important to have that nephrology input.

Operator

Your next question comes from the line of Edwin Zhang.

Xiaodong Zhang

H.C. Wainwright & Co, LLC, Research Division

First one, can you please remind us the purpose and design of the ASPEN and DENALI clinical trials? How are the new study results going to affect or help the adoption of roxadustat in the U.S. dialysis organizations? And then I have a follow-up.

Mark Eisner

Chief Medical Officer

Sure. So the and ASPEN and DENALI trials, they're single-arm, open-label studies conducting -- conducted in large dialysis organizations that, I think, will provide an understanding of roxadustat in a more real-world clinical setting. It is a clinical trial, but it is one that's conducted in a setting that's very much a real-world clinical setting for hemodialysis patients. We are expecting to present data sometime by the end of the year in a scientific meeting. And for the [other] large dialysis organizations, I mean, the data, we are committed to making that available to them at their request so they can further understand the value and the use of roxadustat in their patient populations.

Xiaodong Zhang

H.C. Wainwright & Co, LLC, Research Division

Okay. My next question on pamrevlumab on DMD. Are we going to expect a publication of the Phase II study, including the 2-year data? And what's your current thinking on the market opportunity of pamrevlumab in DMD?

Enrique A. Conterno

CEO & Director

Yes. We'll have Mark answer the question on pamrevlumab, Duchenne muscular dystrophy and questions, in particular, around the 2-year data on publishing the data.

Mark Eisner

Chief Medical Officer

Right. So we are in the process of working to get the 2-year outcomes data published. So I don't have a specific date for you yet, but we're working on that actively. And we do think that's important to show how the benefits continue to be between year 1 and year 2.

Enrique A. Conterno

CEO & Director

And I think you were asking about the overall opportunity in DMD, and maybe let me try to frame that in the context of the 3 programs that we basically have for pamrevlumab. We see each one of these opportunities, whether it's IPF, LAPC or DMD, as significant opportunities. The IPF opportunity, when we look at from a -- clearly, I think it's important to say that the 3 of them are significant unmet clinical needs. The IPF opportunity is expected to be larger than the other 2, LAPC then and then DMD. But each one of those opportunities is significant on its own, and collectively, I think they do represent a massive opportunity. We are -- we expect that we will have the LAPC results and DMD results in the second half of next year from a readout perspective. While in the case of IPF, we have not shared that, but we expect to share at a specific time in the near future.

Operator

Your next question comes from the line of Jason Gerberry.

Jason Matthew Gerberry

BofA Securities, Research Division

I guess just first on the slew of shareholder suits, can you just remind us sort of what's the burden of proof in these matters? I would assume the fact that the FDA is moving forward with an AdCom inherently implies there's some ambiguity around the safety and the upper bounds of the confidence interval on NDD. But just kind of curious if you can just provide a little bit of a helpful legal framework to think about the shareholder class-action suits.

And then my second question is just on DD. Assuming approval, what I wonder about is as the second and third HIFs come to market, what are your thoughts that the dialysis organizations might look to hop from one product ending at [indiscernible] phase and some of the financial benefits to the second and subsequent third products that may offer some of those financial benefits? Just thinking about the longevity of a dialysis launch.

Enrique A. Conterno

CEO & Director

Yes. Thank you. I think on your first question, we do not comment on either ongoing or potential litigation. That's -- as far as your question about HIFs and how would the second or third HIF, whenever it comes, impact the contracting or maybe a dialysis organization being able to move from one HIF to the other, a couple of comments that I would make. First is, clearly, launching first is important, and we've seen that across many different launches across different therapeutic classes because you tend to establish yourself as basically the go-to product, the product that the health care professionals have experience with.

And then second, I think quite frankly, there's no real experience in terms -- or studies showing basically switches from one HIF to the other and who can say that that's going to work well. Keep in mind that our -- at the end of the day, we have to look at also the clinical data and how do the products basically compare overall. So there are a number of variables. And I don't believe this is -- that we should be thinking -- as we've seen in other therapeutic classes that it's either appropriate or that it will be convenient to just basically switch products [in large] from one compound to a different one or the same class. I think there are a lot of considerations that would have to be made.

Operator

Your next question comes from the line of Geoffrey Porges.

Geoffrey Craig Porges

SVB Leerink LLC, Research Division

First one, I'll ask a couple that you probably [kind of wouldn't] answer and then one that hopefully you can. The first is in the discussions with the FDA, can you give us a sense of whether the basis for the labeling discussions is going to be the protocol stratification or the [post tox] stratification? That would be helpful.

And then secondly, you have these Phase II and Phase III studies in CIA and MDS coming in the second half of the year and the beginning of next year. And then obviously, those indications are completely different price points to the dialysis and non-dialysis indications where, of course, you have to think about the bundled rate and all that sort of thing. So have you had any further thoughts, Enrique, about whether you will price differentially for the different markets and whether that's feasible, or whether we should expect you to price pretty much in the same band?

And then lastly for China. Is the reported revenue under the new arrangement that comes into your results as a proportion of the total revenue in market, is that percentage likely to remain relatively constant going forward or actually increase? Or is it just going to be really bouncy?

Enrique A. Conterno

CEO & Director

Yes. Thank you, Geoff, for your questions. Let me first say that when it comes to our interaction with the FDA, I think we're not really providing any detail when it comes to our interactions. Clearly, just in general, I think the -- we expect that the FDA will be looking at the overall evidence, what we -- including what the primary analysis is and also a number of sensitivities around some of those analysis. So far, we feel good about our discussions with the FDA in that they are very productive discussions.

In terms of your question around CIA and MDS, clearly, when it comes to MDS, I think that's where the biggest price differential is. It's also in CIA. But of course, we're going to need to see when it comes to CIA what, based on the Phase II results, what is the dose and so forth and what also -- what is it that we're basically seeing. So I expect that CIA, while there might be some slightly different price points, I don't view them as meaningful. In the case of MDS, there is a pretty significant difference between products in the markets that have been used for MDS and basically what we would price, for example, anemia of CKD with roxadustat.

I think it's fair that we want to make sure that we are appropriately pricing so that we can -- based on the value that the product and the medicine is offering in the different populations. And while that is

always the goal, we all know that, that is a challenge, in particular, in -- it's a challenge in the U.S. how to effectively do that. So at this point in time, we're not commenting on how we are thinking about that. But clearly, that has to be part of our strategic thinking just to ensure that we are appropriately receiving the value for what roxadustat is offering in the different patient populations.

Finally, you asked a question about the relative -- FibroGen reported revenue relative to the overall sales -- net sales to distributors between the joint distribution entity and FibroGen's direct sales. And with that proportion that we reported this quarter, that is going to be the ongoing proportion going forward. There are a number of factors that play into this. We provided some guidance, I think, during the last earnings call that we expected that number will be somewhere between 30% and 45%. We need to -- I -- we continue with that type of guidance. So I think it's going to bounce a little bit based on a number of different considerations. I think the bottom line here is when we look at the overall net sales of roxadustat to distributors, it is pretty clear, I think, that the product is having an incredible performance and is really valued, I think, in terms of what it's offering patients in China.

Operator

The next question comes from the line of Yaron Werber.

Brendan Mychal Smith

Cowen and Company, LLC, Research Division

This is Brendan on for Yaron. Just a couple of quick ones from us. I think, first, looking at the growth of roxadustat sales in China, it kind of looks like January and February sales are maybe more or less flattish. Are there some specific drivers behind that, that you can maybe identify to help us understand just some of the commercial dynamics at play there?

And then secondly, just on the DENALI and ASPEN studies, I think you mentioned just now that we could get data from there maybe by the end of this year. If memory serves me, I think we were supposed to see that data in Q1 of this year originally. So I guess, have there been any delays in enrollment or treatment there that you might be able to comment on?

Enrique A. Conterno

CEO & Director

Yes. Okay. Let me try to address your question about China. And I think you mentioned that the sales in China maybe were -- if I understood correctly, you felt they were flattish in January and February. I don't think that's the case for roxadustat. Clearly, we're basically seeing increased share, and we're seeing increased share in a growing market, right? So we feel very good about where we are. And when we look at our internal sales in the first quarter, clearly -- or the sales that we reported just right now [what is] overall net sales to distributors, I think we've seen a significant increase north of 40% sequentially between Q4 and -- of 2020 and Q1 of 2021. So I don't believe that's the case. And your second question was related to DENALI and ASPEN, and I'm going to have Mark Eisner provide an answer.

Mark Eisner

Chief Medical Officer

Yes. I think that there are 2 different things. One is when -- I mean, as this is an open-label study, it's potentially possible to provide for dialysis organizations data cuts for their own use. So that was, starting Q1, possible. What I was talking about as a distinctive factor was when we expect top line data from the overall study to be available, that -- I think we've been consistent that, that should be by end of year at a medical meeting.

Operator

Your next question comes from the line of Difei Yang.

Difei Yang

Mizuho Securities USA LLC, Research Division

Just 2 questions, circling back to the DENALI and ASPEN trials. Would you be able to clarify if the sites -- the clinical sites are mostly DaVita or Fresenius or is a balance of the 2? And the second question is related to AdCom. So what's the role for AstraZeneca for this AdCom? Is it primarily driven by FibroGen?

Enrique A. Conterno

CEO & Director

Yes. Let me -- just very quickly on DENALI and ASPEN. We're not commenting on who are we doing those studies with. But as we said, it's -- clearly, we're doing this with large dialysis organizations. And as far as the AdCom, of course, FibroGen is the sponsor. So we're the sponsor of the NDA. And maybe, Mark, you can provide some additional comments on the role of AstraZeneca.

Mark Eisner

Chief Medical Officer

Yes. I would describe it as a highly collaborative effort between FibroGen and AstraZeneca. We've essentially formed a joint working team to prepare for the Advisory Committee, to prepare the presentations and get ready for the Q&A. So it's a highly collaborative process between both companies.

Operator

Your next question comes from the line of Paul Choi.

Aliza Bram Seidenfeld

Goldman Sachs Group, Inc., Research Division

This is Aliza on for Paul. A quick one from us. Now that pamrevlumab has Fast Track and Rare Pediatric Disease designation for its DMD program, can you walk us through how you're thinking about any update in timing in this program, regulatory and potentially commercial as well?

Enrique A. Conterno

CEO & Director

Yes. Maybe I will comment on -- I'll make some initial comments, and Mark will add some additional color. Clearly, I think the key for us when it comes to ensuring that we can complete our DMD and be able to bring this medicine to patients is really the enrollment of our trial. So we are working very closely to -- and diligently to try to ensure that the enrollment in DMD for both of our trials can happen as quickly as possible. To that end, we've added a number of additional sites, including now in China where we have gotten the approval, and we started basically recruiting patients in DMD as well that will contribute to the overall global program.

So we are excited about those designations. I think the designations generally basically allow for basically more interaction with the FDA in this particular case related to this program. And I think that's a benefit from a regulatory review process and can provide the basis to be able to move quickly -- more quickly and/or resolve any type of issues in a broad manner. Mark, any additional comments?

Mark Eisner

Chief Medical Officer

No. I think that was well stated, Enrique. I mean, I would say that both the Fast Track and the pediatric rare disease designation from FDA speak to the high unmet medical need and the potential of pamrevlumab to help patients with better outcomes with this high unmet medical need. I think it helps us in terms of enrolling the trial because it's just another way of highlighting how important these studies are. So overall, I think it's a real positive for our ability to enroll these trials and to focus on doing it expeditiously.

Operator

The next question that we have is from the line of Andy Hsieh.

Tsan-Yu Hsieh

William Blair & Company L.L.C., Research Division

Great. So I have 2 questions regarding the China market dynamics, maybe for Chris. So the trajectory in terms of hospitals, it seems, has been very impressive. So I'm just curious, as you kind of reach -- going from about 74% to 80% to 90% [to] high 90%, what are some drivers that your team is thinking about in terms of continuing to grow that revenue line? And also, in terms of the kind of the periodicity of the national reimbursement dynamic, I think every single year, there is kind of scheduled pricing cuts mandated by the government. I'm just wondering what the FibroGen China team is thinking about in terms of kind of preparing for that.

Enrique A. Conterno

CEO & Director

Yes. I think I'll have Chris indeed address both questions when it comes to drivers for revenue growth going forward. In China, we tend to have increased -- there's a limit to given how well we've done with hospital listings in terms of how much will that continue to contribute. And then also, I think you may have a question about the NRDL. And I would say the negotiation for products happens every 2 years, not every year, although there's -- every year, there's some product that will be negotiated. Chris?

Christine L. Chung

Senior Vice President of China Operations

Sure. So to answer the first question, we think of hospital listings as market access. So until you're listed in a hospital formulary, no physician can dispense. So once you get your foot in the door, in this case, roxadustat, you still need to convert the prescribers one at a time. So let's say there are 35 nephrologists in the department. You don't get all 35 in the first day. You might get 5. The next year, you might get 10, and hopefully, there's an upward trajectory. And for every single prescriber, let's say, they have 200 patients, you also don't get the 200 on the first day. You might get 20, and then you might get 25%. You might get [50%].

Obviously, if we were successful, we'd love to get the vast majority of prescribers and the vast majority of their patients, but there's some art to new trajectory. So we see getting our foot to the door in terms of the success we have in hospital listings to bode very, very well for future adoption. But really, we are at the very, very beginning of market adoption of roxadustat. So 74% is very good, which means that 74% of the potential market could actually get access to prescriptions, but that doesn't mean that, that's the end of the uptake. I hope that makes sense.

The second question with regards to NRDL. Enrique is absolutely correct. It's renewed every single 2 years. So roxadustat will be up for price negotiations in Q4 of 2021, and the new price will become effective in 2022. There are obviously a number of factors that they would consider in the price: first is the budget impact of roxadustat on the national health care budget; the second, the value proposition of how much we actually save in health care costs and many other factors in the value proposition; and third is really how strong is the market adoption and how much prescribers value this drug. We remain confident in the outcome of price negotiations.

To be clear, if the price only goes in one way, it always goes down. It never goes up. So it's the discretion of the NRDL in terms of how they value it and how much it comes down. Every single year, they come up with a different set of criteria for determining pricing. The 2019 one was different from 2020. The 2021 eligibility criteria and prioritization has not yet been announced. We're working very closely with market access at AstraZeneca to demonstrate the value of our drugs, and we remain confident about a very good outcome in Q4 this year for the price that will be effective for 2 years thereafter.

Thane Wettig

Chief Commercial Officer

Chris, this is Thane. If I could just maybe piggyback on to your answer on the China trajectory to answer and to provide some more color on Andy's first question. This is really the first time we've provided some granularity around China performance over and above revenue and then snapshots of hospital listings and things of that nature. And so if you take a look at some of the slides that we provided, the first

thing to reiterate is that we've got a market that when you add the ESA growth on top of the category expanding nature of roxadustat, it's a market that's really taken off, which really highlights the commercial responsiveness to this category.

And then when you take a look at the market share perspective we've provided, which is a value-based market share of 27%, we're in the process of turning that value-based market share into a volume-based share calculation, which is a bit difficult given some of the dosing dynamics associated with ESAs. But it's probably fair to say that our current volume penetration is much, much lower than 27%, which just speaks to the significant upside potential that roxadustat continues to have in the China market. And we think it's also -- as Enrique said in his prepared comments, it's a really nice read-through to the other markets when we are able to launch in the U.S. and Europe.

Operator

There are no further questions at this time. I would like to turn the call back to Enrique. Please go ahead,

Enrique A. Conterno

CEO & Director

Very good. Thank you, Erica. We very much appreciate everyone's participation in today's investor call and your interest in FibroGen. Please follow up with our Investor Relations team if you have any questions we have not addressed on the call, and enjoy the rest of your day. Thank you very much.

Operator

This concludes today's conference call. Thank you all for joining. You may now disconnect.

Enrique A. Conterno *CEO & Director*

ANALYSTS

Jason Matthew Gerberry *BofA Securities, Research Division*

Presentation

Jason Matthew Gerberry

BofA Securities, Research Division

Good evening, everybody, and thanks for joining us at the Bank of America Annual Healthcare Conference being conducted virtually this year. Hopefully, next year -- the CDC just gave us the mask-free mandate. So hopefully, next year, we'll be able to do this in Las Vegas.

This is our final fireside chat of a 3-day event, and I'm pleased to be introducing our next company presenter, FibroGen and CEO Enrique Conterno. So Enrique, thanks for joining us.

Enrique A. Conterno

CEO & Director

Jason, thank you very much for the invitation. I'm looking forward to the chat.

Question and Answer

Jason Matthew Gerberry

BofA Securities, Research Division

Yes. Maybe just kicking things off, maybe just talk a little bit about what drew you to FibroGen. You're coming from Eli Lilly, intimately involved in diabetes, large markets, the primary asset, roxadustat also being something that could be used in pretty large markets. And just overall, what drew you to the company?

Enrique A. Conterno

CEO & Director

Well, I think it's the opportunity to work on transformational medicines. And clearly, it's unique for a company the size of FibroGen to have 2 assets in late stage in both roxadustat and pamrevlumab. And then the ability to be able to bring more products into the clinic. So I think it's exciting, I think, just to think about all the possibilities.

And clearly, I think when we think about roxa, when we think about pam, not just 2 new medicines, but truly 2 medicines can be quite transformational and truly first in class. So quite unique, and I feel that my experience was a really good fit for the company.

Jason Matthew Gerberry

BofA Securities, Research Division

Okay. Maybe we'll talk a little bit about roxa and the potential role that it could play in the dialysis setting, both dialysis and non-dialysis dependent. We could talk about -- a little bit about some of the unique assets of the U.S. market, which hopefully you'll be able to bring that medicine to market. Well, we can get in the time line considerations and then maybe some of the vagaries of what's going on with FDA.

But maybe we'd just set the table for this medicine, which nobody really denies the efficacy benefit that it can provide. It's orally dosed. It has benefits -- unique benefits in certain patients like hyporesponders. So maybe just how do you think about this kind of medicine in the key indications that you're pursuing relative to standard of care, which is an ESA in dialysis, and in non-dialysis, there really isn't a standard of care?

Enrique A. Conterno

CEO & Director

Yes. Clearly, I think it's a pretty significant unmet clinical need when we look at anemia of chronic kidney disease and the opportunity to have a product -- an oral product like roxadustat basically with the type of data that we shared both on DD as well as NDD.

When it comes to DD, as you well said, we have a standard today, which are ESAs that are widely used for people that are on dialysis for the correction and maintenance of hemoglobin, people who have anemia. So it's an important -- it's clearly a very important segment that most of these patients are being treated. Of course, the data that we're -- that we've been most excited about has been the incident dialysis data.

And just to remind everyone, I think when we look at roxadustat, we view it as comparable on both dialysis dependent on non-dialysis dependent, comparable to ESAs on dialysis dependent and to placebo on non-dialysis dependent. And we have now, I think, the opportunity to -- so patients are starting those treatment with dialysis to be able to treat anemia. And we think that roxadustat can be an ideal choice there given the strength of our data and particularly incident dialysis.

When it comes to some additional opportunities, you well pointed out that there are a number of patients that are hyporesponders. We estimate those to be -- to ESAs, we estimate that segment to be as high as 20% of the overall patients on dialysis.

When it comes to NDD, we basically have few patients being treated. In fact, when we look at the 12 months prior to initiation in dialysis, we see that only about 14% of those patients are treated with an ESA. So clearly, a pretty significant opportunity to increase those treatment rates. And clearly, the benefit of that is to try to avoid transfusion, minimize the risk of transfusions.

We are working very closely right now, very diligently to prepare for the Advisory Committee that we -- that has been tentatively scheduled for July 15. I'm excited about the opportunity to share data publicly, quite frankly.

Finally, I think it's important to maybe mention, maybe I'm sounding a bit optimistic, but I am given what I've seen what the product can do. And we can talk about China in a bit. Particularly, the performance in China, I think, is a perfect example of what the transformational product could do. Clearly, the adoption that we're seeing by hospitals, physicians, the feedback from patients, I think, is outstanding. And it's been reflected, I think, on the results that we see.

Jason Matthew Gerberry

BofA Securities, Research Division

Great. You guys have these Phase IIIb trials that are being conducted with dialysis organizations. Can you just remind me what's the status of those trials? Will that -- oftentimes, when new medicines come around, they may help investigators get more experience outside of the rigid trial context, right? Can I switch a patient? How easy is it to switch a patient? Which patients do I feel most comfortable with in terms of utilization of the medication? So maybe just a little context for initiating those trials with large DOs? And what do you think that will help accomplish when you are ready to get to market?

Enrique A. Conterno

CEO & Director

Well, I think those -- first, I think those studies are Phase IIIb studies, and they are important because we are looking at roxadustat in a real-world setting with those large dialysis organizations. Those trials are now fully enrolled. And in fact, some patients have already gone into the extension phase. And we look forward to sharing that data, I think, at a future scientific meeting. Of course, the data will be available to the large dialysis organizations for them to be able to see, I think, the benefits of roxadustat in those specific settings.

Jason Matthew Gerberry

BofA Securities, Research Division

So you -- presumably, with the dialysis approval, you have a TDAPA reimbursement. We've now seen very limited analogs. The analogs that we have seen is basically Amgen's Parsabiv and not necessarily apples-to-apples with what you'd be dealing with because there's not a generic alternative to what you have. It's a biosimilar alternative efficacy-wise.

And so I guess I wonder ultimately if you can speak to some of the practice -- or dialysis organization economic considerations. I realize that your medicine offers much more than an economic benefit to practices. But just how organizations will navigate that because arguably under TDAPA, there's less of a burden on the practice financially to experiment with the new novel medication.

Enrique A. Conterno

CEO & Director

Yes. No, I -- thank you for your question. Clearly, as you well highlighted, I think we really start with the clinical benefits that roxadustat has when it comes to patients on dialysis. And we discussed 2 specific types of patients, patients that are starting dialysis or patients maybe that are hyporesponsive, as very specific patients with roxa can have some of the largest benefits.

But when we think about some of the access, maybe frameworks that are utilized in this particular case, we believe that roxadustat will be eligible for TDAPA. So we intend to basically request TDAPA reimbursement be eligible for that. TDAPA is basically payment adjustments for products that otherwise

would be on the renal bundle. And it's designed -- TDAPA is designed to basically foster and incentivate innovation by basically providing this payment adjustment or additional payment.

Importantly, the considerations here are that the dialysis organization would receive an additional payment when using roxadustat. Of course, this needs to be approved by CMS, and we're working to -- as soon as we get approved, we're going to be working to ensure that we are prepared to make that submission to CMS so that we can get the eligibility as soon as possible.

Jason Matthew Gerberry

BofA Securities, Research Division

Got it. So the interesting thing, I guess, is Amgen, the way that the bundle adjusted post Parsabiv, like they're down 50%, or they're pointing down 50% in terms of their sales level coming out of the TDAPA phase. I mean some of that's just driven, I guess, by the volume pressure. Once that TDAPA phase ended, a lot of maybe DOs went to Sensipar -- generic Sensipar because -- but ultimately, I think part of that, too, is that the bundle didn't adjust to address the Parsabiv pricing level.

Now I guess how do you see that situation evolving for roxa? On the one hand, you could argue we're different. Maybe your product's more innovative. But there's an ESA there. And so maybe the bundled payment allotted for ESAs represents maybe a good benchmark for where your net reimbursement level may come in kind of post TDAPA.

Enrique A. Conterno

CEO & Director

Yes. I think the concept of TDAPA when it comes to trying to foster innovation within the [dialysis] protocols is to ensure that as we think about those 2 years where those TDAPA payments would exist -- and by the way, that's -- we -- that's the current framework basically, TDAPA will last for 2 years. During that time, CMS will basically be assessing the product to determine how the products will be treated now within the bundle, right? And that assessment has to be based on the utilization of the product but also the benefits that they see with the product relative to not utilizing the product.

So I think it's -- at the end of the day, I think the world post TDAPA would be governed by how well did roxadustat perform within the 2-year period as assessed by CMS. I'm quite confident on what roxadustat can deliver. So this bundle, I think it's difficult to say what would be this bundle post TDAPA. But I think it's good to think about the formal assessment that is done and then basically ensuring that these payments are now basically taking some of the benefits that we're seeing into account. Otherwise, if they don't do that, at the end of the day, you're providing only a temporary benefit or economic incentive. But if the clinical benefits are there, I think they need to be rewarded as well.

Jason Matthew Gerberry

BofA Securities, Research Division

Okay. Now NDD is an interesting market. It's very sizable. It -- from what we hear from physicians, one of the reasons why ESAs are underutilized is because of the restrictive hemoglobin targets. What we hear oftentimes is they've got a lot of patients whose hemoglobin levels are around 9, 9.5, can treat to 10. It doesn't make any sense to maybe even start because the hemoglobin thresholds are so restrictive.

Your trial protocol allows for more flexible hemoglobin targets. So just typically, when drugs are given the green light to be studied in a certain way by FDA, they're labeled according to study. So maybe if you can speak to that dynamic and your confidence level that the FDA is comfortable with treating the higher hemoglobin levels. Because it seems like it's an important variable, ultimately from our perspective, to really unlocking the value and getting these patients anemia medication.

Enrique A. Conterno

CEO & Director

Yes. Yes. So clearly, when we looked at our trials, as you point out, I think the hemoglobin target level was 11 plus/minus 1 with roxadustat. We -- as you know, we don't comment on our interaction with the FDA

or try to speculate on what the label will look like. But clearly, I think the results that we've discussed are based on protocols that basically look at those specific targets.

One thing to keep in mind, and I think I'm reflecting on what we basically are learning from China as we think about the NDD market and some of the dynamics there, it is pretty clear that we might be underestimating the long-term opportunity when it comes to building that market in NDD. I think we've said for quite some time that we expect that the uptake when we look at the dialysis setting will be fast, and maybe a higher proportion of the overall patients will be dialysis-dependent patients relative to vis-a-vis NDD but that over time, we expect the NDD opportunity to scale to be much larger, significantly larger than the DD opportunity.

And what we basically see in China is exactly that. It's -- in China right now, I think it's 1/3 of the patients -- or 35% of the patients today are patients in the NDD setting and 65% DD. But what's more interesting is to look at the dynamics of the overall market, which may seem a little bit counterintuitive because since roxadustat was launched in China, what we've seen is actually the ESA market accelerate. So not just continue to expand. It is continuing to expand, but it's actually expanding faster than it was prior to the roxadustat launch.

That is pretty unusual, and it speaks to a pretty unmet need. And now that we are, together with AstraZeneca, commercializing the product and -- in China. But also talking about anemia, the importance of treating anemia, not just in the DD setting but in the NDD setting, I think what is -- basically it's making the category for anemia significantly larger. So this type of trend that I'm describing is -- and these types of trends tend to last not just for quarters, but these tend to be trends that basically play out over years. So I'm extremely encouraged by what we see there.

And I think the one thing that we maybe underappreciated, in addition to all the clinical benefits, because sometimes we tend to be quite scientific, but it's -- the fact that this product is an oral product. And as we know with ESAs, basically patients have to go into a physician office to have the product administered. That will certainly happen. That's the practice here in the U.S. So the fact that it's an oral product, I think, provides a different level of maybe also convenience in addition to some of the clinical benefits.

So you have the importance of treating anemia and avoiding or minimizing the risk of transfusions. But then in addition to that, we look at some of the specific benefits of roxadustat, and we add to that the fact that it's an oral product, and I think it makes the opportunity significantly larger maybe than we initially saw.

Now of course, I am translating China into other markets. And I think for the most part, I think it's a fair assessment outside of access because access to the product tends to vary and be very specific from market to market. But outside of access, I feel like physician adoption, we can -- there's a lot of learning that we can take from China, and that has to been pretty encouraging.

Jason Matthew Gerberry

BofA Securities, Research Division

Right. And I mean I guess, we, as drug analysts, are very -- oftentimes end up being very U.S.-centric. And typically, when a new major launch hits a category, it kind of grows the broader category and other drug categories benefit from that. So do you think -- if you had to come up with a hypothesis in terms of what's going on there, what's driving that ESA utilization, is it more or less doctors are now starting to just treat more and having to go to other options as well?

Enrique A. Conterno

CEO & Director

Yes. Clearly, our -- this is something that we are studying. But I think what -- this is my view. What we're seeing is basically additional treatments, in particular, so increasing the treatment rate, in particular, in the NDD market. And that increase is so significant. The -- not only is roxadustat growing very fast. As you know, we basically had \$43.5 million in Q1 in net sales to distributors. That's an increase vis-a-vis the 29-plus that we had in Q4 of 2020, so very -- a good sequential growth.

So yes, it's pretty interesting to see, I think, what's happening. And I think it's all about -- it's been largely driven by increases in the treatment rate in NDD. And I think that bodes extremely well for the future.

Jason Matthew Gerberry

BofA Securities, Research Division

Yes. So you've put some rough guidance parameters around the revenue opportunity for roxa in China. I think greater than \$500 million based on the guidance that's out there. You seemingly have gotten coverage in hospital setting or for the dialysis center setting much faster than I think you would have expected. So maybe what's next? What are the future catalysts? Or is it just kind of an execution story going forward in that market?

Enrique A. Conterno

CEO & Director

Yes. It is an execution story. Keep in mind that we don't expect another HIF-PHI in China for some time. And as you well said, our -- we now basically have access to about 74% of the overall CKD anemia opportunity in China. And that's going to continue to increase.

What are some of the additional drivers of growth? It is about basically continuing the adoption cycle. So we will see increased adoption in hospital where we're listed. What's the concept there and why do I feel highly confident is we basically have much higher share in incident dialysis, which in a certain way, those patients tend to carry through and become patients that are on prevalent dialysis. So over time, we -- that incident dialysis will basically be reflective of the overall share that we have in the dialysis setting. So it is a matter of continuing to execute our strategy. There's additional opportunity for increased listing, but really, I think the big opportunity is going to be on both the adoption but also on the adherence, making sure that the length of therapy is appropriate so the patient can get the full benefit.

And yes, we've guided to peak sales of north of \$0.5 billion for roxadustat in China for CKD anemia. So for us, it's basically executing our strategy. Keep in mind that we have additional opportunities, indications in China. We are pursuing both MDS, CIA also in China. So chemo-induced anemia and myelodysplastic syndromes. Those indications are above and beyond the guidance that we have provided.

Jason Matthew Gerberry

BofA Securities, Research Division

Yes. Okay. Maybe just shifting to the U.S. market opportunity and regulatory situation in terms of -- so it sounds like this is a joint collaborative effort in terms of your preparations and getting ready for the advisory panel. Maybe just talk about how helpful it is to have AstraZeneca as a partner here in terms of navigating the upcoming regulatory outcome.

Enrique A. Conterno

CEO & Director

Yes. Clearly, for us, I think a critical job is going to be our preparation for the Advisory Committee to be held on July 15. To do that, I think you probably know there's a -- given all the learning, there's a -- we've put together a really good process to ensure that we're going to be as prepared as we can be. That includes anything from doing mock reviews, mock outcomes and so forth.

But importantly, too, is I think it's key that we work -- continue to work collaboratively with the FDA to allow the Advisory Committee to have the best assessment of the product so that they can appropriately advise. I feel very strongly about this. And I feel that our preparation is giving me additional confidence in terms of what I expect will be a very productive and positive discussion at the AdCom on July 15.

Jason Matthew Gerberry

BofA Securities, Research Division

You gave a little bit of a preview, I think, on the last earnings call. Yes. It seems kind of obvious in the sense when you have these therapies that are undeniably effective, right, in categories like this that the

focus tends to be just around a vote around views on safety and risk/benefit. But wondering if there's any other additional commentary you want to offer there.

Enrique A. Conterno

CEO & Director

No. I think at the -- when it comes to an Advisory Committee, clearly, you're bringing relevant experts to provide perspective, advice to the FDA. And risk/benefit, the benefit/risk is always part of that discussion. Clearly, I think when it comes to the efficacy, I'm sure that it would also be discussed. But I think with roxadustat, it's pretty clear, very consistent and consistent across many different patient types, including patients that have inflammation and so forth.

And the -- when we look at our data, we have a number of different trials, both in DD and NDD. And then we need to look at the overall cardiovascular profile. And as I mentioned, we see our profile being, when it comes to MACE, noninferior to ESAs on DD and non-inferior comparable to placebo on NDD.

The -- so at this point in time, of course, the FDA will look at the primary analysis, but I'm sure we will also do a number of additional sensitivity analysis and we -- that I'm sure will be discussed. Those sensitivity analysis, in some cases, look -- make the product -- or hazard ratios lower, in some cases, higher. But all in all, I think should help understand, I think, the overall profile of the product better. And I'm optimistic about -- given our preparation that we will have a good [showing].

Jason Matthew Gerberry

BofA Securities, Research Division

Yes. It seems to me the key challenge is the managing the magnitude of complexity for the panelists given the different studies, the different analyses and how you can have a focused discussion. We know sometimes advisory panels can sometimes -- there can be some confusion just given the quantums of data involved.

Enrique A. Conterno

CEO & Director

Yes. And I think it's probably important to reflect of what makes -- well, there are a number of factors, what factors can we influence appropriately to make sure that we can have a productive discussion at the AdCom. And as part of that, of course, our preparation is part of that. But also, I think to the collaboration with the FDA and making sure that all the analyses are truly informative, I think, could be important as well. So it's -- data is coming soon, and we're looking forward to it.

Jason Matthew Gerberry

BofA Securities, Research Division

Yes. So are we. So I guess just a final question because we're almost out of our time. But pamrevlumab, IPF, maybe if you can just comment how -- you got some dynamics going on, I assume, with the enrollment. You have COVID, but you also have a competitor who wind down their IPF trial, large IPF trial. Maybe that might be a tailwind for enrollment. Just any color you can provide on that process.

Enrique A. Conterno

CEO & Director

Yes. Two things. First, when it comes to pamrevlumab, the first readout that we will see are in LAPC, locally advanced unresectable pancreatic cancer, and DMD, Duchenne muscular dystrophy. And we have basically guided towards a readout in the second half of next year for those 2 important indications.

When it comes to IPF, you're right. I think both COVID, the fact that we are seeing basically less cases of COVID, but in addition, the fact that one of the product that was being studied for IPF recently stopped their trial. Both of those, I think, are helping our involvement. We do have additional sites as a result of that, that are now basically enrolling pamrevlumab. And also on sites that maybe we're enrolling both trials, now we have additional patients, patients that basically can come into our study. So I think the

dynamics, I think, when it comes to enrollment have been getting more positive than what they have been.

Jason Matthew Gerberry

BofA Securities, Research Division

All right. Well, great. Well, Enrique, thanks so much for your time and best of luck here in the coming milestones for the company.

Enrique A. Conterno

CEO & Director

Jason, thank you very much for the time, and congratulations on a successful conference.

Jason Matthew Gerberry

BofA Securities, Research Division
Thank you. All right. Operator, with that...

ANALYSTS

Michael Jonathan Yee Jefferies LLC, Research Division

Presentation

Michael Jonathan Yee

Jefferies LLC, Research Division

Well, good morning, everyone, and welcome to another great session here on the last day of our 2021 Jefferies Virtual Global Health Care Conference.

We've had a great week, obviously, this week. And one of the teams, I'm obviously looking forward to meeting with here today is FibroGen. We have the CEO, Enrique Conterno, here with us. And obviously, a lot going on at the company and obviously, gearing up for some important decisions and important events this year.

I would just love to start off, Enrique. Maybe you could give some opening comments about where FibroGen stands today with roxa, obviously, both the U.S. and the European developments kind of going on simultaneously. And that would be great as you prepare, obviously, for an AdCom and a whole lot of different scenarios. So that would be great, to turn it over to you.

Enrique A. Conterno

CEO & Director

Thank you, Michael, and great to be here, be able to chat with you once again.

We continue to be enthusiastic and excited about the opportunity of roxadustat to be able to reach patients around the world. Let me cover briefly how I see the different regulatory discussions and then I'll move into also China and the -- basically we're commercializing, which I know is of interest as well.

When it comes to the U.S., we do have an AdCom coming very soon, July 15. We -- maybe my level of enthusiasm is because of -- also of our preparation. We feel very good about our preparation and how diligent we've been, and we look forward to basically having a really good discussion about the benefit/risk profile of roxadustat, which is really the intent of all of these AdComs.

I expect this will be done for each one of the indications that we're pursuing in DD and NDD. Keep in mind, I think what -- and I think it's important that I highlight that roxadustat has shown comparability when it comes to both placebo in NDD and relative to EPO in DD.

And while we are -- when we look at the hazard ratio of -- in incident dialysis, well, it is not below -- while the upper bound is not below 1, the hazard ratio, the estimate is still below 1, and it looks very, very positive. We can comment more way, this is important. And I think it's a reason for us for our success in China as well.

Clearly, Europe is also coming quickly. Astellas is the sponsor for that application. And at this point in time, they've guided towards an approval, including -- they basically have provided a forecast for roxadustat for the fiscal year 2021 across both Japan and Europe, about \$80 million. And it is pretty clear that they're also been enthusiastic about the ability for us to be able to reach patients with this important product.

Now beyond approval, I think it's important that what can we learn from our success in China and Japan, but let me comment a bit more about China because we -- the last quarter, we recorded net sales to distributors of \$43.5 million.

I think it's fair to say this is -- this has been a very successful launch. We feel very good about where we are, including -- basically, at the end of the day, is how health care professionals and patients are basically responding to roxadustat, which is they are getting great feedback, great results in real life, and as a result of that, they have continued to adopt the product as a main staple as part of their practices. We continue to see those trends in the same direction that we've seen in over the last few quarters, which has been a constant of sequential growth. And we feel very good about where we are in China. And as I mentioned before, I think we have guided in terms of China in the area of anemia of CKD as having big sales, north of \$500 million, not \$500 million, but north of \$500 million, we clearly continue to

see this. AdCom is coming quickly. I know there's a lot of high level of interest in that. And I think you will see us very well prepared to address all the questions from the panel.

Question and Answer

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. That was good. And I think there are 3 unique areas of value: U.S., Europe, China and each is kind of a different moving part. Let's take those chronologically. I mean, I guess, in the United States, which, let's be frank, is perhaps, in my opinion, the largest opportunity.

There is consternation amongst Wall Street because there wasn't -- there was not expected to be an AdCom. Now there's an AdCom. You're preparing for that AdCom. What do you think drove the change in the thinking for an AdCom such that it's even in a different AdCom division than the actual filing? Like how do we tie that together because does that say something? What does that imply? Have you had discussions with that regulatory group who's doing the AdCom?

Enrique A. Conterno

CEO & Director

Yes. The division that is reviewing the file continues to be the same. This is the hematology division. I -- as you know, I think in the FDA, you have the divisions and then you have the office. The office is the one that calls for the AdCom. And the AdCom that is related to this office is the renal and cardio AdCom.

So I'm not sure -- honestly, I'm not sure there's a change there. It just -- if there were to be an AdCom, that's how things would have proceeded. So this is not a matter of having an extension and having an AdCom that comes very, very late. So clearly, I think when it comes to any products that will be looked at in this area, in DD and NDD, purely cardiovascular safety is a key topic, and it's of key importance. And we expect that we're going to have all the appropriate expertise to ensure that the benefit/risk profile of the product is discussed extensively and that's what we are ensuring that we're prepared, so we can answer any questions.

Michael Jonathan Yee

Jefferies LLC, Research Division

Have you been engaged with that review group who is in that AdCom and doing that? Like there must be people there, have they had meetings with you? Do you have the draft book? Do you kind of know what's going on there?

Enrique A. Conterno

CEO & Director

Yes. There's really no contact between a sponsor and AdCom members. In fact, I think they look for AdCom members that have -- that can clear conflict of interest. So -- and no, we have not received the Ad book.

We are working closely with the FDA when it comes to analysis and so forth. And I think it is important that walking into the AdCom to be as aligned with the FDA as possible. And how do we interpret any type of different analysis and so forth. We do submit a briefing book, basically, 30 days before the date of the AdCom to the FDA. And I -- at this point in time, I think we continue to prepare, and we look forward to having that day.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. In the scenarios from that AdCom, we could have a really positive vote, we could have a mixed vote. We can have a negative vote. We could have positive and negative votes by indication because you did say you think that the benefit/risk will be taken independently for non-dialysis and dialysis. And presumably, you think the risk/benefit is great for both.

Do you believe that those -- that the FDA sees there to be a difference in benefit/risk there one versus the other? Because, honestly, non-dialysis is a different patient population than dialysis. And it was running against a placebo whereas everyone -- these other sponsors claim that they want it against Aranesp. So maybe just make a comment about the benefit/risk in non-dialysis versus dialysis because some people believe there might be a split label here.

Enrique A. Conterno

CEO & Director

Yes, that's not our view. We believe that we will get a broad indication, so covering both DD and NDD. I think it's important that we maybe take a step back and talk about some of the benefits of treating anemia. Probably the one that is most pressing and one that we've seen as part of our extensive clinical trials, is basically that roxadustat was able to reduce the risk of transfusions.

Clearly, given that we were comparing to placebo, that benefit was very significant in our trials in NDD. As you know, when it comes to patients having transfusion, the more transfusions that they have, it lowers the risk of the potential for transplantation sometime in the future.

So we view, and I think we -- that's -- we view, I think, the benefits of the product has been very significant. Something that is probably that we have come to understand a lot better in China as well, which is something that we don't talk maybe enough about.

But clearly, there is a -- having a novel product is something that is pretty important. Keep in mind that in NDD, which is the population that you were asking a bit about patients, about 90% of the patients actually have to go to a physician office to get their ESA treatment.

So having an oral alternative, I think is going to be quite important for those patients to truly have access to treatments that are accessible truly and convenient. In addition, of course, to all the clinical benefit that we've mentioned, including that roxadustat is just a more physiological way to be able to treat anemia, right?

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes, yes. Okay. And then as regards, let's say, we do -- so we do -- I mean get approval for both, do you believe that the FDA sees cardiovascular risk differently as well in non-dialysis than dialysis? Because I think you've spoken before about the fact that, hey, if you're treating against a placebo, how can one say that there's greater cardiovascular risk, then again, some people believe it's a class effect.

They just stick all "ESAs" there and just slap the same label because the FDA is conservative. Now at this point, it feels like the stock and the valuation of the company doesn't reflect any of that at this point anyways. But that's always an important idea. If you do get approved because you're confident in approval that the black box would be construed differently. How do you feel about that?

Enrique A. Conterno

CEO & Director

Yes. It's -- clearly, we don't -- I don't want to speculate on what the label may look like even we need to see the discussion of an AdCom. And quite frankly, I think when it comes to the AdCom, you are going to have panel members there that are going to be providing their views with different experiences and so forth.

And the FDA will, of course, take all of that input into consideration when thinking about both approval and potential labeling. But the data pretty clearly shows in our view that we are comparable to placebo. And I do believe that the FDA makes all efforts when it comes to label to ensure that the label for the respective product is the one that is included as part of that. I think I've been pretty consistent on that, and I think we've seen it across many different classes.

Michael Jonathan Yee

Jefferies LLC, Research Division

Can I ask a question, this is a nuance, but it's actually come up and that relates to this, which is we talk about class labeling. And is the class defined as ESAs, such that it is erythropoietin-stimulating agents? Or is it the idea that any mechanism that stimulates erythropoiesis, ESAs as erythropoiesis-stimulating process, not stimulate erythropoietin, do you -- can I just ask question -- because we actually did some work on this and the term ESAs or the class of ESAs -- because there's only been one mechanism, so it's almost like they're interchangeable.

Do you think that the FDA may view the concept that the mechanism being different is actually a different process, and that is not stimulating erythropoietin? Again, sort of that nuance because it's actually interesting because how would you argue that the mechanism is quite different?

Enrique A. Conterno

CEO & Director

Well, the mechanism, I think it is quite different. And I think I don't want to speak for the FDA, but clearly, maybe if they didn't think about that differently, maybe we wouldn't have the AdCom, right? So it is a different mechanism. Now -- and we do see different things, right, with the HIF versus an ESA. And we are very excited about providing that alternative to patients.

Keep in mind one thing, Michael, I think when we think about dialysis dependent, right -- because let's not go just to the mechanism, and let's go to the actual -- what we actually see, right? It is pretty clear to me that today, there are a number of patients on dialysis that basically are having a tough time managing their anemia. Part of this is because they are hypo-responders. So -- and this is very well documented. You have to continue to increase the ESA dose. Dose increases have their own element of risk.

So in a certain way, having this new medicine would basically provide an opportunity for many of those patients that actually need an alternative to be able to manage their anemia.

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes.

Enrique A. Conterno

CEO & Director

I think that's pretty clear. And we saw that reflected in our data, right, in particular, for people that had high elevated CRP.

Michael Jonathan Yee

Jefferies LLC, Research Division

I guess I would just argue that if the idea of erythropoietin, which is a recombinant protein, that is what EPO is. Yes, that protein does stimulate erythropoiesis to make more red blood cells. Your drug, because it gives you system ESAs, you're stimulating erythropoiesis but doing it in a different mechanism.

That's all I wanted to say. We don't know that giving greater erythropoietin protein is driving a different etiology than what your drug is. I just want to say that it's class label.

Enrique A. Conterno

CEO & Director

Yes. I appreciate you saying that. And it's -- once again, we look forward to having the discussion at the AdCom. I think we have very comprehensive data. So we -- it's great to have so much data because it's the opportunity to be able to answer fully questions of the panel.

Michael Jonathan Yee

Jefferies LLC, Research Division

So when you're going to get to a panel, you've submitted or about to submit your briefing document.

Enrique A. Conterno

CEO & Director

Yes, we have not -- but -- submitted the briefing doc -- briefing document gets submitted, I believe, 30 days prior to an AdCom.

Michael Jonathan Yee

Jefferies LLC, Research Division

Then the FDA will give you a briefing document weeks before.

Enrique A. Conterno

CEO & Director

That's right. They will -- I mean, the way things work or they should work is that we are -- that we need to work collaboratively with the FDA to ensure that the panel can have the best discussion.

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes. Should that happens and then whatever happens with the vote, do you expect that a PDUFA obviously, which never got renewed, do we just go in sort of a black hole and you'll just say, hey, look, we're in discussion with the FDA and there's no defined deadline, then we can move on from the U.S. Is that fair?

Enrique A. Conterno

CEO & Director

Yes. I wouldn't describe it as a black hole, but yes, we don't -- the PDUFA date can only be extended once, which it was. So therefore, at this point in time, there's no other -- there's not a new PDUFA date. I think, fortunately, we were quite advanced with the FDA on labeling discussions in December. So I am hopeful that post the AdCom, the FDA will be able to take action.

Michael Jonathan Yee

Jefferies LLC, Research Division

Yes. Good. Thank you for bringing that point, I mean the point that you were as of December in labeling discussions and, quite frankly, AstraZeneca, your partner put in the press release that they look forward to continued discussions.

And I think they did actually use in the press release the word label. I think that's actually -- it was not like they got stuck halfway through whether this thing is proved or not, it was actually trying to figure out the label.

Now whether that's carving out a label, labeling in a certain way, black box, I just want to be clear, let's reemphasize that you were actually talking about labeling discussions, and you were down to that level.

Enrique A. Conterno

CEO & Director

Yes. So I think we were -- clearly, now we do have the AdCom. So you were asking timing after that. And we're hopeful that things could proceed that the FDA could take action quickly because of those advances.

Michael Jonathan Yee

Jefferies LLC, Research Division

Because you were fairly deep into everything in.

Okay. And then in Europe, really quick, what you've done in Europe. Look, Astellas has put out financial quidance. Can you speak to the idea of that process, meaning there's a CHMP recommendation.

I know there is member states and I think select representatives that actually lead that. But in general, do you have insight into that at all other than just what Astellas says, your insight and feel like that's going in a different way, and you feel very good about that?

Enrique A. Conterno

CEO & Director

Yes. We continue to feel good about our -- the review process in Europe. Clearly, the next step would be an opinion. CGMP will provide an opinion.

And that's coming quickly. And as you know, from that opinion then -- assuming a positive opinion, then an approval would come a couple of months after that.

Michael Jonathan Yee

Jefferies LLC, Research Division

How are we thinking about appealing? Is that -- now they meet once a month. Do I need to check my Friday of June and July and August, and it could come on any one of those?

Enrique A. Conterno

CEO & Director

Yes. We're not providing more comment, that's really a question for Astellas, but we've guided towards an approval in midyear, so I think you can do the math, right?

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. Well, I want to get really nuance, I guess, is approval means the actual label or approval means the recommendation because the approval comes 2 months after the recommendation?

Enrique A. Conterno

CEO & Director

Yes. Approval is approval and opinion is an opinion.

Michael Jonathan Yee

Jefferies LLC, Research Division

Well, I better check my June calendars, my associate team is on that right now.

That's good. That's good. And again, we cover Astellas out of Asia, and they're saying Astellas is quite positive, too. So that would be a surprise upside, certainly, if we can have that. Good.

What about China? I'd love to spend a couple of minutes there because interestingly, we have the development of the approval, the launch has gone well. Maybe just talk to what's going on there and how that seems to be quite independent of everything going in U.S. and in Europe? Like did you tell them also about the change in the statistics on incident dialysis. Is there label change at all?

I have not read the Chinese label, and I got to put that through Google Translate. I don't read Chinese. But what is that? Do they have a superiority label for things? Or what are they saying at all?

Enrique A. Conterno

CEO & Director

No. If you recall, I think the China submission was based on China data, China trials.

Michael Jonathan Yee

Jefferies LLC, Research Division

This, efficacy. Right.

Enrique A. Conterno

CEO & Director

Yes. And so that happened prior to us submitting in the U.S. and so forth. So these data from the pivotal trial were utilized in the U.S. was not utilized for that approval.

Michael Jonathan Yee

Jefferies LLC, Research Division

Right.

Enrique A. Conterno

CEO & Director

Clearly, China is going extremely well. We've highlighted the significant listing progress that we made over the quarters. We are now roughly about 75% of listing, so 75% in terms of the amount of coverage of the anemia of CKD China market. That's very impressive. And we see basically increased adoption. We've seen sequential growth every single quarter, basically, the quarter number 5 after we got reimbursement with \$43.5 million worth of net sales to distributors.

We feel good in terms of the feedback that we -- and I have been emphasizing this, the feedback that we are receiving from not just key opinion leaders, but general health care providers, professionals, it is pretty clear that they see significant value when it comes to roxadustat and the ease of use, and we see that basically reflected in the numbers.

Maybe an update I can provide to you, it's basically reported, but China just issued new guidelines, anemia of CKD guidelines, stand-alone guidelines. So that's pretty important. Sometimes you have anemia guidelines. Sometimes you have international guidelines, but these are the first stand-alone guidelines in China for anemia of CKD. So -- and roxadustat is very well positioned.

So we are excited about that. We just basically got done. I believe it was maybe June 1 or late May, but this is a very recent development.

Michael Jonathan Yee

Jefferies LLC, Research Division

What -- so it's like treatment guidelines. What does that say in a nutshell?

Enrique A. Conterno

CEO & Director

Well, in a nutshell, it basically provides the framework for treating anemia, first of all, which is very key. And the importance of treating anemia and the goals of treating anemia that is important because one of the significant opportunity that we basically see, basically the growth of this market. And let me comment just a little bit more about that in just a second.

But so you basically look at targets and then the alternatives, right, that should be utilized in both DD and NDD and being formally including this in guidelines because treatment by roxa is still new therapy in China, right?

We are talking about 5 months post reimbursement -- or 5 quarters post reimbursement. So the opportunity for increased adoption is significant. Something that we've noted, Michael, and -- but I think it's -- we expected some of these dynamics, but the way that they're presenting, I think, it's very interesting when we look at the overall growth of the anemia treatments in China. Keep in mind that post roxadustat being introduced, which, by the way, now roxa is basically the #1 brand for anemia of CKD in China. But post it being launched in China, we've seen actually the growth of ESAs accelerate.

Michael Jonathan Yee

Jefferies LLC, Research Division

You're growing the market, you're growing the market, and these treatment guidelines are going to help that.

Enrique A. Conterno

CEO & Director

Correct. And so I am so encouraged by this because I think it bodes very well for the overall expansion of the market and in particular, when it comes to NDD. And to me, I think I view the adoption by physicians that we basically see in China as a great signal what we could see in some other markets around the world.

Michael Jonathan Yee

Jefferies LLC, Research Division

Let me ask one final question because I know we're 1 minute over. But with the change of the statistics around some of the analysis, I know that ASN has some comments on their publication, if you go to that. And I know that you guys are working through those changes. You've actually been communicating with FDA and doctors, I guess. But it's not a true -- so there's not really -- this is investigational. But are you working to get that publication fixed at all? And maybe just make a comment on that.

Enrique A. Conterno

CEO & Director

We do. I think clearly, I think we want to make sure that the -- what's out there when it comes to incident dialysis is basically -- and MACE, basically, reflects the data that we've talked about when it comes to the prespecified certification factor. So we are in the process of working through that. And at this point in time, I think we made quite a bit of progress.

Michael Jonathan Yee

Jefferies LLC, Research Division

Okay. Well, look, you guys were in final negotiations, and then we have this AdCom show, it is far down the review path. You guys -- obviously, it sounds like we just want to get some clarifications on this done. So hopefully, that doesn't turn everything so far upside down. You are already in label discussions, and we'll hear that.

We've got the briefing documents set up, and we'll hear about that over the next month. We'll see you on the July 15 review in Europe, which I just figured out too, could happen at any point. Good. Thank you very much.

Enrique A. Conterno

CEO & Director

Very good. Thank you very much, Michael.

Michael Jonathan Yee

Jefferies LLC, Research Division

All right.

Enrique A. Conterno

CEO & Director

Great seeing you.

Michael Jonathan Yee

Jefferies LLC, Research Division

Of course. Thank you.

Enrique A. Conterno

CEO & Director Bye-bye.

Kyuwon Choi Goldman Sachs Group, Inc., Research Division

Presentation

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Okay. Welcome back, everyone, and thank you for joining us on Day 3 of the 42nd Annual Goldman Sachs Global Healthcare Conference. I'm Paul Choi, and I cover the mid-cap biotechnology sector here at the firm. And our next session will be with FibroGen.

Joining us from management is CEO, Enrique Conterno. What we'll do as in prior sessions is we'll turn it over to Enrique for some opening commentary, and then we'll go into Q&A. [Operator Instructions]

But otherwise, with that, we'll turn it over to Enrique.

Enrique A. Conterno

CEO & Director

Thank you, Paul, and thank you for the invitation. A few comments on FibroGen. We are, of course, excited about the -- having the outcome with the -- here in the U.S., and the preparations are going well. The outcome is July 15. Also waiting for the regulatory decision in Europe. That's another important milestone for us.

And of course, I think, continue to be very bullish about our performance in China with roxadustat. So all eyes in roxa, U.S., Europe, China. But we should not forget pamrevlumab, which is our monoclonal antibody, anti-CTGF, basically pursuing 3 indications in idiopathic pulmonary fibrosis, locally advanced unresectable pancreatic cancer and Duchenne muscular dystrophy. And those trials are enrolling well. We have -- we expect readouts for 2 of those indications in the second half of next year.

And finally, something we don't often talk about, but it's our belief that we can bring new product with significant clinical value into the clinic. So we've been working both internally and also looking externally to basically strengthen our overall early pipeline. So I look forward to your questions, Paul.

Question and Answer

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Okay. Thanks, Enrique, and thanks for joining us. Maybe starting with roxadustat in China, we can start with the commercial piece. And you and your partner provided a recent commercial update on the earnings call. But can you maybe talk a little bit about how it's progressed since your last update? What is market uptake like? And I had a follow-up on that as well.

Enrique A. Conterno

CEO & Director

Yes. It's very exciting to see the performance of roxadustat in China. We commercialized the product with AstraZeneca. We have a 50-50 profit share in China, just to remind everyone. And I think what's exciting is basically looking at the adoption of the product, adoption-driven because we are -- we've been now listed in north of 70% of hospitals that comprise -- sorry, hospitals that comprise 70% of the overall anemia CKD opportunity in China. And then, basically, adoption within those hospitals.

Our revenue -- sorry, our net sales to distributors in Q1 of this year was \$43.5 million. That's basically quarter 5 after updating reimbursement in China. So very significant uptick for the product. I think one thing probably that is worthwhile highlighting is that when we look at the market dynamics in China, what we basically see is now roxadustat becoming the #1 brand in terms of value in China for anemia of CKD, but importantly, when we look at the rest of the market, ESAs, when we look at the ESAs, we've actually have seen that ESAs growth has actually accelerated since the launch of roxadustat.

So all of -- I think that speaks extremely well for the overall health of the overall market. The growth that we're seeing -- and I expect that growth has significant led for not just months, but for quarters and years to come. So very excited about what we basically see there.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Could you maybe dive a little more into where you're seeing the growth and adoption in China so far? Are you seeing it primarily in the dialysis setting, incident dialysis and maybe -- or NDD populations? Just help us understand how the practitioners and clinicians and dialysis centers there are taking a look at adopting roxa?

Enrique A. Conterno

CEO & Director

We do. I think the -- let me first try to break that down for you. Around 65% of the volume we see basically roxadustat being utilized through dialysis centers or dialysis settings. The rest basically is non-dialysis-dependent settings. What is important to highlight is maybe that the use of roxadustat is pretty broad. And if there was a surprise that we've had since we launched in China was basically the uptake in NDD. We know that the potential in NDD long-term is very high. So we expect good growth for many years as we build that market. But what we've seen is basically faster uptick than maybe we were expecting in that particular setting.

The areas where we see the product being utilized should not be a surprise. We see basically patients, incident dialysis patients, patients that are hyporesponders to ESAs and in -- most of the growth is, when we look at roxa, I mentioned where our growth is coming, but we look at the overall market, I -- we don't have very definitive data, this acceleration that we see in the overall market, it is because we are seeing basically NDD basically taking off. So I think that's very exciting. And we view that as a very significant long-term opportunity for us.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Maybe one more on the commercial piece here before switching to the regulatory side, which is you talked about the unexpected growth in NDD. But as you take a look -- and you think about the opportunity and how you think about the revenue composition over the longer term. How do you think about that NDD being a portion of your longer-term revenue mix in China versus the dialysis setting?

Enrique A. Conterno

CEO & Director

Yes. What I -- I think what we've said, not just for China, but in general, is that we expect that dialysis would be faster uptick, but we believe that the NDD opportunities significantly larger, meaningfully larger than DD. So we expect that opportunity to be larger over time. Maybe something to -- worth highlighting, Paul, is that China has recently issued guidelines, stand-alone guidelines for anemia of CKD.

And roxadustat is front and center on some of those guidelines. So we're pleased with how roxadustat is recommended as part of those new guidelines. But I think what that's telling you is also that is exciting, that's going to basically -- is a reaffirmation of better the decision that health care professionals are making in China to utilize roxadustat more and more often.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Maybe we can pivot now to the U.S. regulatory piece. And I guess, question one is, have you had any subsequent interactions or even at an informal level with the FDA since your last update to the street with your quarterly results? And then I had a couple of follow-up questions.

Enrique A. Conterno

CEO & Director

Yes. Clearly, we are working towards the outcome, and that involves quite a bit of preparation. I believe those preparations are going very well. And as part of that, we have exchanges with the FDA, and it is, I think, in the interest of everyone to ensure that the that we can go into that -- into those meeting extremely well prepared so that the AdCom panel can have the most productive discussion possible in that setting. And yes, we've had productive and good discussion with the FDA in preparation for that.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Has the agency any -- offered any sort of commentary that would strike you as sort of different from the way you guys are thinking about it in any sort of meaningful way? And have they provided any suggestions that maybe -- or commentary that -- versus your thinking on how to approach the AdCom that you would sort of message to the street as being potentially novel or incremental?

Enrique A. Conterno

CEO & Director

No. My -- first, I think we don't comment on the regulatory interactions with the FDA. But clearly, I think the discussions are intended to, yes, look at how -- try to understand how the FDA and how we are interpreting all of the data, what are -- is in our interest to understand where the focus will be. As you know, the FDA will have a briefing book. We are preparing one as well for -- to submit to the FDA, and that's -- so all of that, I think, is going to be important, I think, for the AdCom.

But one thing that is -- when it comes to any type of AdCom, it's sometimes difficult to predict the exact topics of discussion with the AdCom because we are bringing AdCom committee member that they have a lot of expertise, and they're bringing that external perspective, external to the FDA.

So the interest is to make sure that the briefing books are as clear as possible, and that the discussion can be as productive as possible. But from our perspective, we need to be very well prepared and broadly prepared so that we can address any type of questions that they may come.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. A little while back, you provided an update on the longer-term roxa data that you previously presented at Kidney Week 2019 that resulted in some changes in some of the cardiovascular hazard ratios and ranges for roxadustat across the various populations you've studied. And so I guess, as you look at that update as you -- and as the company and regulators have digested that updated data, can you maybe update us on your thinking of what the safety signal is, what is the messaging there? And then as a follow-up to that, has the agency expressed any particular view on what -- how to think about the statistics?

Enrique A. Conterno

CEO & Director

Yes. I think what the data -- what the data shows is -- what the analogy shows is basically the roxadustat is comparable to ESAs to EPO in the DD setting and comparable to placebo in the NDD setting. And I think that's what we basically can say based on how we conducted those studies.

Clearly, when it comes to the AdCom, we have to be -- we're very well prepared when it comes to MACE, but we've got to be prepared for any topic that may come and ensure that we're providing all of the appropriate background when it comes to anemia of CKD in order to have the full discussion.

We -- you may recall that we shared that we had communicated to the FDA when we made some of those changes, the data had both sets of analysis have been submitted to the FDA that were part of the NDA. So that discussion was a productive one. We shared at that time. And at this point in time, I think we feel good going into the outcome.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Okay. Great. Maybe in terms of your preparations themselves, can you maybe talk to us about what are you doing? Are you doing mock AdComs? What sort of practice runs or preparations are you doing here? And then I had a follow-up to that.

Enrique A. Conterno

CEO & Director

Yes. I think the preparation for an AdCom, I think, is -- tends to be pretty rigorous. I would almost describe it as a bit of a science, but there's some art to it as well. And I think you want to make sure that you are creating the situation that is as comparable to the outcome as possible. So yes, you do a number of mock rehearsals, if you wish, they have a formal feedback, formal briefing books, and you get advice and in some cases, criticism, the intent is to make sure that we can learn from each one of those rehearsals to be prepared as possible for questions that may come. What was helpful for -- towards the understanding, and at the end, making sure that the discussion once again can be as productive as possible. I think it's in everyone's interest.

Kvuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. You brought up something interesting earlier, which is that you said you have to prepare for any type of question. And so I guess, as you and your team and outside consultants, think about what the AdCom could look like. What do you think about key topics and potential vote questions could look like as the AdCom approaches here on July 15?

Enrique A. Conterno

CEO & Director

Yes. Clear, I think it's difficult because I think, as you know, I think those questions would depend on the briefing books, and also on the questions that the FDA is asking the outcome to basically brought on at the end of the day. But I think the expectation, as is in every outcome is that the FDA will be seeking

feedback on the benefit risk profile of the product. And I expect this is going to be done for each one of the indications, DD and NDD.

We do have to -- when I say we have to prepare broadly, I think it's important because we are -- we might be a little bit closer to the product, and we have to -- while there are going to be briefing books and so forth, those need to be helpful so that the AdCom committee members can have all the background, not just on the product, but on anemia of CKD and ensuring that there is a full picture and a full understanding of that, so that the appropriate assessments and the appropriate discussions can happen.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Maybe taking a bigger picture view, how do you and the company sort of think about the agency's stance on the headset as a class. Especially given the updates on your side as well as the recent NDA acceptance of Akebia's vadadustat not too long ago. And so what does that, from your perspective, say to you about the agency's stance on the class?

Enrique A. Conterno

CEO & Director

I mean, it's -- I'm not sure what I would make of it. I think the FDA tends to be very focused on the data of the sponsor. So there are a number of examples where products from the same class have received very different labels based on their own data. And this is particularly important when the data is -- tends to have the number of patients, as you basically see in cardiovascular study.

So when it comes to cardiovascular studies, you basically see the FDA labeling for each particular product to basically be reflective of what those specific trials demonstrate as opposed to thinking about all products are the same. It is not that only the first product in the class gets asked to conduct CV studies, all of them ask and then -- so I've seen the -- the experience that I have is that the FDA tends to be quite focused on the specific data. And I think that's what will carry the day for us, which is, I believe the FDA will focus on the overall roxa data in each DD and NDD as they make their assessment and decision here.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. You also earlier brought up an important point, which is that, obviously, roxa has been developed and filed for European filing and the MAA filing is under review here with a potential decision coming up here during the summer. So how do you think you and your partner -- think about that opportunity? And sort of what are the next steps there for a potential commercial launch in the European market?

Enrique A. Conterno

CEO & Director

Yes. Clearly, the -- our partner when it comes to Europe and Japan is Astellas. So they are the sponsor in Europe. I -- the discussions with the regulator are I would describe them as proceeding well. But it is probably a better question for Astellas than for us. What I can share is, I think, maybe just highlight what Astellas has communicated. They recently provided guidance for roxadustat when it comes to fiscal year 2021. They shared that they expected revenues -- net revenues from roxadustat to be and I'm translating from yen here, but about \$80 million.

And they also provided recently as part of their strategic overview, long-term projections for roxadustat for their territories, Astellas' territories. So this includes Japan, Europe and a few other smaller territories. But the projection that they provided, if I recall correctly, was JPY 50 billion to JPY 100 billion, which you would translate -- I don't know what the exchange rate is today, but at the time I translated that, it was about peak sales somewhere between \$450 million and \$900 million for those geographies.

So we are excited about the opportunity to have these products reach patients in Europe, but really across the world. And you're right, I think that we are expecting, I think, the opinion, I think, any time now.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. And could you maybe just sort of broadly remind us of the economics with your partner there, Astellas in those territories?

Enrique A. Conterno

CEO & Director

Yes. We basically have a royalty we share for both of our partners in the low 20% range.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Okay. Great.

Enrique A. Conterno

CEO & Director

So we are fully reimbursed on all development and commercial costs outside of China. I think that's important to mention. In China, where we have a 50-50 profit share, but outside of China, we basically would receive a royalty.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Turning to the commercial side here in the U.S. Can you maybe help us understand what is sort of the state of the union with regard to dialysis here in the market in the U.S. as you think about a potential roxadustat launch over the near-term in the U.S. and just kind of what is the impact from COVID as you're launching potentially in the near term?

Enrique A. Conterno

CEO & Director

Yes. Clearly, honestly, we are extremely encouraged from our learnings in China and how much -- how the fast adoption that we've seen for the product in China. Clearly, the dynamics in the U.S. are different from a payer perspective, and I'll discuss those, but I believe that physician adoption will be basically similar to what we basically see in China with faster adoption maybe in the dialysis setting. And in NDD adoption over time, but once again, the opportunity in NDD is significantly larger over time.

Clearly, when it comes to DD, the framework for reimbursement is TDAPA. This is a payment adjustment or an additional payment that would be done that the dialysis organization will receive that would be outside of the dialysis bundle. TDAPA is designed to basically foster innovation. And it had last for a period of 2 years. And our preparation is to ensure that once we receive approval in the U.S. that we can submit for TDAPA eligibility right away.

And TDAPA eligibility becomes effective. The first day of a quarter, so that's going to be key, I believe. And that's really the true catalyst for use, I think, in the dialysis setting. When it comes to NDD, I think the reimbursement is a bit different. It's a matter -- the Medicare opportunity is slightly north of 50%. Commercial, maybe about 30%, and then Medicaid, the rest.

And in order to ensure that the product can reach patients, we will need to be included in formularies. And clearly, for the NDD setting, that would be extremely important. And I think there are a number of benefits that I think that we can highlight for payers. But once we have that coverage, if you wish, across the different settings, I expect that the decision adoption will be very fast.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. I do want to talk about the other parts of the pipeline, but maybe just one more on the commercial piece, which is that clinicians are typically not used to treating patients with ESAs in the NDD setting, it's

kind of a novelty there. So how do you think about receptivity and how do you think about driving changes in physician behavior there?

Enrique A. Conterno

CEO & Director

Yes. Clearly, it's 2 things that really matter initially is going to be basically, okay, the label that we have, what is the label saying? But then also the experience -- the initial experience the physicians will have with the product. There are a number of clinical benefits, I think, which I think we've shared before, but I believe, for example, in the dialysis setting, we are going to be utilized in incident dialysis, our patients are starting dialysis, I believe that roxadustat can be the product of choice there and also when it comes to patients that are hyporesponders to ESA.

And in NDD, I think for the most part, most patients are not treated, but we have to recognize that outside of all the clinical benefits, I think there are significant limitation for the use of ESAs in that setting, including that patients have to go to physicians' offices to have the product administered. So we view, I think, roxadustat offering significantly more convenience as well in addition to some of the clinical space.

That -- I mentioned that because I think I failed to mention that in the past and what I -- what we basically see in China is that, that might be a pretty important engine for growth and to increase treatment rates, which at the end, I think it's going to be key, I think, when we look at the NDD segment.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Okay. Great. Let's spend a little bit of time shifting to pamrevlumab, and you focused on 3 development opportunities and maybe we can start with IPF here. Can you maybe just help us understand what's going on and what sort of the enrollment progress with your 2 ZEPHYRUS studies coming out of COVID here and just sort of perhaps provide an enrollment update for us?

Enrique A. Conterno

CEO & Director

Yes. What we basically have seen is as the COVID situation has improved, and particularly, in the U.S. first, we've seen significant improvements in enrollment across all of our trials. But probably most meaningful when it comes to our ZEPHYRUS IPF trial.

I think it's important to remind everyone that when it comes to IPF, the data that we produced in that pamrevlumab showed as part of our Phase II is very meaningful. We view that data as basically showing the meaningful effect size, highest -- largest effect size of any product in IPF, whether they are in the market or in development.

So if we were to replicate those type of results, I think that will be incredibly important for patients. We have not provided guidance when it comes to when would we expect a reader for IPF, but we expect to provide guidance very soon.

We are seeing improvements in enrollment, in particular, when it comes to U.S. and probably driven by, as I mentioned, the overall COVID situation improving in the U.S., but also because there was a failure of a competing product that has made a number of sites and also patients eligible now for pam. So we are excited about basically what we're seeing.

Outside of IPF, we have 2 additional indications that we're pursuing. And both of those are expected to read out in the second half of next year. And they are -- we are seeing LELANTOS-1 enrolling well. This is the trial for DMD. And then we're seeing LAPIS, the trial we are conducting for locally advanced and resectable pancreatic cancer, also enrolling very well. So we are excited about having those readouts coming in the second half of next year.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Specifically, perhaps with regard to the pancreatic trial, can you maybe just remind us what is considered a successful result with regard to the endpoint and respectability? And just as you mentioned, timing would be second half of next year, potentially. And how is that data contextualized in the setting of the current parent treatment paradigm?

Enrique A. Conterno

CEO & Director

Yes. Clearly, I think they are very, as you know, very limited options when it comes to unresectable pancreatic cancer. So having a positive trial in -- for that population will be huge. It's a huge unmet need. It's -- when we -- you're correct, when we're thinking about the readout that we will have is a readout based on certain number of resection events.

And clearly, I think we need to see a separation, important separation there. The -- based on that readout, we expect to, assuming it's positive, we expect to ask for an accelerated approval and have the discussion with the FDA.

Of course, they will be looking also at the overall trend when it comes to overall survival and so forth. But clearly, if there is an important difference when it comes to resection, I think we're going to feel highly confident about the overall benefit. So that's key. I think when it comes to overall survival, I think we will have to wait longer for that to finally read out.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Okay. Great. That makes sense. That will take a little longer. Maybe just turning back to IPF for a moment. And you did highlight a competitive failure, but there is still some competitive intensity in the space as well as establish incumbent drugs such as Esbriet. And so I guess, how do you think about the commercial opportunity there? The drugs that are approved are sort of growing at a multibillion-dollar rate here.

And so I guess, is this an opportunity to grow the pie collectively? Or do you maybe think about it more as a share gain sort of a potential market for pamrevlumab here?

Enrique A. Conterno

CEO & Director

Yes. Keep in mind that the needs in IPF are still very significant. And of course, I think we'll have to rely on the data. But assuming that the data, we can replicate the data from our Phase II trial. I believe that pamrevlumab will be used in a very meaningful way as an option to treat patients on -- with IPF.

You keep in mind that the current therapies sometimes are not well tolerated. I estimate that maybe about half of the patients, in some cases, are -- don't tolerate those therapy well and need to look for some other options as well. I think what's important about pam and I think what we showed, I think, in the Phase II trial is not just the clinical efficacy that we typically look at. But also, the reason to believe, because, as you know, the first time that really a product has shown from an imaging perspective, basically, I think the improvement when it comes to fibrosis, right?

So that to me, I think, is very significant. And clearly, I think it could be a huge benefit. We need to wait for those Phase III trials to read out. But it is -- I have a high level of conviction when it comes to pamrevlumab in IPF and the commercial opportunity, as you just mentioned, I think it's very significant.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. While obviously, people are focused on development of roxa for CKD, you are also pursuing development of it in other indications and opportunities. Namely, you're in a late-stage trial for evaluating roxa in MDS. Can you maybe, first, provide us an update on how that trial is going? And then sort of secondly, there is a drug approved from Bristol and Acceleron in this area of anemia for MDS, and just how you think your data stacks up versus REBLOZYL here?

Enrique A. Conterno

CEO & Director

Yes. We are -- as you well mentioned, we are pursuing roxadustat also in MDS. Importantly, that we are in a Phase III trial and the readout for that trial is expected in the first half of next year. So that's coming soon. We are just, for a matter of being complete. We're also, as you know, pursuing chemo-induced anemia and we expect data in the second half of this year for that Phase II trial.

Both opportunities are important to us. Clearly, when it comes to MDS, I think we see, I think, the significant success that luspa is having and we need to wait for a readout, but I think the expectation that we have is that our data is going to be somewhat comparable to the data that luspa has shown. As you know, we're starting our product in a broader population than what luspa initially targeted their trials at.

And when it comes to chemo-induced anemia, we view that, that opportunity as very significant. In fact, the way that we think about it is CKD being the largest opportunity but chemo-induced anemia being maybe an opportunity that could be about 80% of the opportunity that we see when it comes to anemia CKD, but MDS being a smaller opportunity than that.

Clearly, the product that you made reference to is priced differently than an anemia CKD opportunity. I know you've asked me in the past, how would we think about pricing of the product and so forth, that's something that we need to be -- that we need to work through. Of course, it's going to be data dependent. But we need to think about how do we ensure that we can capture the value of the product at the end is delivering. And -- but that sometimes it's difficult to do across indications where the pricing of that is very, very different.

So that's some work for us to continue to do. I think what's -- from a commercial perspective, though, what's in front of us is right now, ensuring that we are ready to launch roxadustat across the world as the regulatory decisions in Europe and U.S. are coming very shortly.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. Thanks for that. We're coming up on time, Enrique, but I did want to go back to something you mentioned earlier, which is you're talking about, at some point in the not-too-distant future, talking to investors about your next wave of development efforts here.

And so could you maybe sort of paint some broad strokes as to where FibroGen might be heading in terms of its next wave of development? You obviously have a lot going on with your current pipeline, but sort of what is the next stage, potentially, of FibroGen look like here?

Enrique A. Conterno

CEO & Director

Yes. Clearly, we need to make sure that first, we leverage the strength of the size that FibroGen has when it comes to both HIF biology and CTGF biology. And it is pretty clear that the HIF biology is quite involved and could have a number of different applications. So we need to make sure that we leverage the opportunities that we have.

Throughout the last 1.5 years, we've done a full assessment of all the programs that we have here at FibroGen, and we've been pretty disciplined to make sure that we are investing on the product that have the most merit. And that we believe have likelihood of truly bringing innovation to patients. So that has happened.

In addition to our internal efforts, we are also looking externally at opportunities. Now we've been pretty diligent. We have not done a transaction as you know, I think we need to have conviction around the science and the clinical opportunity, but also about making sure that we can create value. So we've looked at a number of things, but we've been disciplined in terms of our assessment and so forth, but you should not be surprised if at some point in time, we bring additional assets.

And we are thinking, in particular, in that preclinical space and for signs that we have significant conviction in areas where we think we can move quickly and create a lot of value.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Great. We're just about up on time here, Enrique. So we'll have to end it on that note. Thanks to you and FibroGen for joining us today.

Enrique A. Conterno

CEO & Director

Thank you very much, Paul. Appreciate the invitation.

Kyuwon Choi

Goldman Sachs Group, Inc., Research Division

Yes. Thanks.

Enrique A. Conterno

CEO & Director

Thanks.

FDA Briefing Document

Cardiovascular and Renal Drugs Advisory Committee Meeting July 15, 2021 Roxadustat

The committee will discuss the safety and efficacy of the New Drug Application (NDA) 213805 for roxadustat, an oral film-coated tablet submitted by FibroGen, Inc. The proposed indication is for the treatment of anemia due to chronic kidney disease (CKD) in adult patients not on dialysis and on dialysis.

DISCLAIMER STATEMENT

The attached package contains background information prepared by the Food and Drug Administration (FDA) for the panel members of the advisory committee. The FDA background package often contains assessments and/or conclusions and recommendations written by individual FDA reviewers. Such conclusions and recommendations do not necessarily represent the final position of the individual reviewers, nor do they necessarily represent the final position of the Review Division or Office. We have brought roxadustat to this Advisory Committee in order to gain the Committee's insights and opinions, and the background package may not include all issues relevant to the final regulatory recommendation and instead is intended to focus on issues identified by the Agency for discussion by the Advisory Committee. The FDA will not issue a final determination on the issues at hand until input from the Advisory Committee process has been considered and all reviews have been finalized. The final determination may be affected by issues not discussed at the Advisory Committee meeting.

Introduction

This is the FDA briefing material for the July 15, 2021 meeting of the Cardiovascular and Renal Drugs Advisory Committee. The Committee will discuss the data in support of New Drug Application 213805 for roxadustat, to consider its benefits and risks for the applicant's proposed indication: "Roxadustat is indicated for the treatment of anemia due to chronic kidney disease (CKD) in adult patients not on dialysis and on dialysis."

Erythropoiesis stimulating agents (ESAs), such as epoetin alfa and darbepoetin alfa, are typically used in the treatment of the anemia of CKD, and they increase red blood cell (RBC) mass through the same mechanism as endogenous erythropoietin. Roxadustat is an orally administered reversible inhibitor of hypoxia inducible factor (HIF)-prolyl hydroxylases (PH). Inhibition of HIF-PH is thought to increase levels of endogenous erythropoietin, thereby increasing erythropoiesis. By avoiding supra-physiologic plasma levels of exogenous erythropoietin analogues, the applicant hypothesizes that there will be fewer undesirable effects, thus providing a safer alternative to ESAs. The applicant also believes that roxadustat has salutary effects on iron metabolism that will reduce the requirements for iron in these patients. If approved, roxadustat would represent the first drug in this class in the United States (US). Importantly, additional drugs in this class are in late-stage development, and may be submitted to FDA for evaluation.

The NDA includes an extensive database in support of roxadustat's efficacy and safety for both the NDD and DD populations. The development of roxadustat for the two populations proceeded concurrently; therefore, results of the DD studies were not available for the planning of the NDD studies, and vice versa.

For the NDD patient population, three similarly designed, adequate and well-controlled studies support roxadustat's efficacy for the treatment of anemia. These studies, referred to as anemia "correction" studies, enrolled patients with CKD who were anemic at baseline (mean hemoglobin [Hb] ~9 g/dL), and randomized them to roxadustat or placebo. A fourth study was unique—with randomization to roxadustat or darbepoetin alfa—and provides the ability to compare the efficacy and safety of roxadustat to an ESA in this population.

For the DD patient population, there were also three principal studies; these enrolled patients with CKD and incident or stable dialysis. At baseline, the mean Hb was slightly higher than in the studies in the NDD population, about 9.6 g/dL overall. These studies compared roxadustat to epoetin alfa. A unique study, considered separately, was conducted in Europe and permitted the use of two different ESAs (epoetin alfa or darbepoetin alfa). One of the ESAs (Eprex, epoetin alfa) is not licensed in the US and is not considered to be the same as US licensed Procrit/Epogen (epoetin alfa).

As is the case with ESAs, roxadustat is titrated to achieve a target Hb level, and roxadustat's efficacy is not in question. All studies in both the NDD and DD patient populations demonstrated efficacy. The principal issue before the Committee is the drug's safety, and safety with respect to the specific CKD patient populations.

During the development of drugs for the treatment of anemia of CKD, we have generally asked sponsors to demonstrate noninferiority (or superiority) with respect to major adverse cardiovascular events (MACE) for both the dialysis and non-dialysis populations (vs. an active comparator and placebo,

respectively). In this development program, MACE included the following events: all-cause mortality (ACM), non-fatal myocardial infarction (MI), and non-fatal stroke. (The MACE composite here differs slightly from the composite typically used in cardiovascular outcome trials; here all-cause mortality, rather than cardiovascular mortality, was used.) The applicant has provided these MACE assessments, as requested, and they represent an important part of this application.

Placebo-controlled studies in the NDD patient population enrolled subjects with significant anemia, and because anemia was less likely to improve in subjects who received placebo, they were more likely to discontinue from the study. Thus, for the three trials overall, completion rates were 62% and 41% in patients randomized to roxadustat and placebo, respectively. The difference in completion rates confounded a number of the safety analyses; in particular, the MACE results are sensitive to the duration of post-treatment observation.

Beyond MACE, a number of safety issues merit consideration and are described herein.

Roxadustat

As noted above, roxadustat is an orally administered reversible inhibitor of HIF- PH, intended to improve anemia in patients with CKD in both the NDD and DD populations.

Roxadustat is proposed to be available as a film-coated tablet for oral administration containing 20, 50, 70, 100, or 150 mg of roxadustat. The proposed recommended starting dose for patients on dialysis or patients who are not on dialysis and not on an ESA is 70 mg three times per week (TIW) in patients weighing <100 kg and 100 mg TIW in patients weighing ≥100 kg.

Roxadustat is not marketed in the US, but has marketing authorization in the People's Republic of China (December, 2018) and Japan (September, 2019). Both countries approved use first for the treatment of anemia due to CKD for patients on dialysis followed by an approval for patients not on dialysis. Based on the safety data submitted in this NDA, the People's Republic of China has updated the English language version of their label to include safety information for cardiovascular events, vascular access thrombosis, deep vein thrombosis, seizures, and serious infections. The English language version of the Japanese label has a Boxed Warning for serious thromboembolism including cerebral infarction, myocardial infarction (MI), and pulmonary embolism. Additional notable adverse reactions in the Japanese labeling are thromboembolism, including shunt occlusion, and seizures.

Anemia of Chronic Kidney Disease

Anemia is a common complication of CKD that develops early in the course of the disease and worsens as CKD progresses. The overall prevalence of CKD in the US adult population is estimated at 15%, with an estimated 17.2 million having Stages 3-5 CKD. The prevalence of anemia increases as the glomerular filtration rate (GFR) declines [1, 2]. It is estimated that 50% of patients with Stage 4 and 5 CKD not on dialysis and 90% of patients requiring dialysis are anemic. The etiology of anemia of CKD is multifactorial and includes erythropoietin deficiency, impaired ability to absorbiron (iron deficiency), inability to utilize stored iron (chronic disease), blood loss, and shortened RBC survival. Symptoms of anemia include fatigue, reduced exercise tolerance, and dyspnea.

Currently available therapeutic options for anemia of CKD include iron, ESAs, and RBC transfusions. Patients with CKD are routinely monitored for evidence of iron deficiency and treated with iron if deficient. Approximately 8% of patients with Stage 4 and 13% of patients with Stage 5 CKD receive an

ESA. Pre-end-stage renal disease use of an ESA in the adult population by age category ranges from approximately 12% to 17% [3]. Most patients with CKD receiving hemodialysis (HD) require ESAs to correct anemia and reduce the need for RBC transfusion and its attendant risks, including the risks of alloreactivity and rejection after kidney transplantation. In order to place roxadustat into proper context in the armamentarium of therapies for the anemia of CKD, some general background on ESAs is important.

Erythropoiesis Stimulating Agents

Epoetin alfa is a glycoprotein manufactured by recombinant DNA technology that contains the identical amino acid sequence of isolated natural erythropoietin and has the same biological effects as endogenous erythropoietin. ESAs bind to and activate the human erythropoietin receptor and stimulate red blood cell production in the bone marrow. ESA use for these indications has spanned over 30 years.

Currently marketed ESAs include epoetin alfa, darbepoetin alfa, methoxy polyethylene glycol-epoetin beta, and epoetin alfa-epbx. Dosing can vary from three times a week to monthly, depending on the specific agent and setting. All are administered by the intravenous or subcutaneous routes; none can be orally administered.

Table 1: US-Licensed ESAs for the Treatment of Anemia Due to Chronic Kidney Disease (CKD)

Product Names Established (trade)	ApprovalYear		
epoetin alfa (Epogen/Procrit)	1989		
darbepoetin alfa (Aranesp)	2001		
methoxy polyethylene glycol-epoetin beta (Mircera)	2007		
epoetin alfa-epbx (Retacrit)	2018		

Subsequent to the initial approval of an ESA for patients with CKD in 1989, the ESA labeling has undergone significant revisions because of accumulating knowledge from safety surveillance and clinical trials. These labeling revisions have included the addition of a Boxed Warning for increased mortality, serious cardiovascular and thromboembolic events; warnings for hypertension, seizures, and thrombotic events including vascular access thrombosis; and in dosage and administration, a reduction in the recommended "target Hb," and a recommendation to discontinue the ESA in patients in whom Hb does not respond adequately over a 12-week escalation period. Other major adverse reactions of ESAs include thrombosis, hypertension, seizures, and pure red cell aplasia.

ESA use in patients with CKD can confer an increased risk of MACE. Clinical trial data have established that targeting higher rather that lower Hb levels increases the risk of MACE, yet the Hb target that best balances benefits and risks has never been identified for any of the ESAs.

The US Normal Hematocrit Trial [4] was the first in a series of randomized controlled trials (RCTs) designed to test the hypothesis that a higher target hematocrit in subjects receiving hemodialysis (HD)

would result in improved outcomes. A cohort of 1233 patients with end-stage renal disease (ESRD) on HD with symptomatic heart failure or ischemic heart disease was randomized (open-label) to either partial treatment of anemia (hematocrit of $30\pm3\%$) or full correction (hematocrit of $42\pm3\%$). The primary endpoint was death or first non-fatal MI, analyzed by time to event. The trial was terminated at the third interim analysis for futility and potential harm in the full anemia correction group. There were 202 primary endpoint events in the full correction group compared to 164 events in the partial correction group: risk ratio 1.3 (95% confidence interval [CI] 0.9–1.9). Also, 39% of subjects in the full anemia correction group had vascular access clotting vs. 29% in the partial treatment arm (P = 0.001).

The CHOIR study [5] was a randomized, open-label, active-controlled clinical trial in patients with NDD-CKD that aimed to show superiority of full anemia correction by ESA administration in terms of cardiovascular events and death. In this trial, 1,432 patients with CKD and anemia (Hb < 11 g/dL) received epoetin alfa and were randomly assigned to a target Hb of either $13.5 \, \text{g/dL}$ or $11.3 \, \text{g/dL}$. The primary endpoint was a composite of death, MI, hospitalization for congestive heart failure, or stroke. The study was also prematurely stopped for futility after an interim analysis at a median study duration of 16 months because it was considered unlikely that benefit would be demonstrated for the primary composite cardiovascular endpoint. In fact, there were 125 events among 715 subjects in the high-Hb group vs. 97 events among 717 subjects in the low-Hb group (hazard ratio [HR], 1.34; 95% CI, 1.03 to 1.74; P = 0.03), with death and hospitalization for heart failure accounting for 75% of the events.

The CREATE study [6] in 603 patients with CKD stages 3–5 (26% with diabetes) failed to demonstrate the superiority of full anemia correction (Hb target 13.0 to 15.0 g/dL) with respect to cardiovascular events, as compared to partial correction of anemia (Hb target 11.0 to 12.5 g/dL), when starting ESA therapy at an earlier stage than ESRD.

Subsequently, TREAT, by far the largest trial, examined cardiovascular and kidney outcomes in 4038 patients with Stage 3 and 4 CKD [7]. TREAT was the only large placebo-controlled study to assess cardiovascular outcomes. Patients received either darbepoetin-alfa to achieve a Hb target of $13.0 \, \text{g/dL}$ or matching placebo with rescue darbepoetin-alfa when the Hb concentration was < $9.0 \, \text{g/dL}$. The HR for the first co-primary endpoint, the composite of death or a cardiovascular event, was $1.05 \, \text{(p=NS)}$. The HR for the second co-primary endpoint, death or ESRD, was $1.06 \, \text{(p=NS)}$. There was, however, a nearly two-fold increased risk of stroke (HR 1.92; $95\% \, \text{Cl} \, 1.38-2.68$) in the higher vs. lower Hb group, in patients both with and without a past history of stroke. In addition, venous thromboembolic events occurred significantly more frequently in the high Hb arm (2.0%) compared to the placebo arm (1.1%, p=0.02).

Based on these clinical trial data and safety surveillance, the ESA labeling was revised again to include the aforementioned warnings.

The international 2012 Kidney Disease Improving Global Outcomes (KDIGO) Clinical Practice Guideline for the Evaluation and Management of Anemia of Chronic Kidney Disease [8] recommends addressing all correctable causes of anemia (including iron deficiency and inflammatory states) prior to initiation of ESA therapy. The guideline recommends balancing the potential benefits of reducing blood transfusions and anemia-related symptoms against the risks of harm in individual patients (e.g., stroke, vascular access loss, hypertension) (1B). For adult patients with NDD-CKD and Hb concentration < 10.0 g/dL, the decision whether to initiate ESA therapy can be individualized based on the rate of fall of Hb concentration, prior response to iron therapy, the risk of needing a transfusion, the risks related to ESA

therapy, and the presence of symptoms attributable to anemia (2C). For adult patients with NDD-CKD and Hb concentration \geq 10.0 g/dl, ESA therapy is not recommended (2D). For adult patients with CKD stage 5 on dialysis, ESA therapy is recommended when the Hb is between 9.0 and 10.0 g/dL (2B), and the KDIGO Guideline advises against use to maintain Hb above 11.5 g/dL (2C).

Hypoxia-inducible Factor Prolyl Hydroxylase Inhibitors

Hypoxia-inducible factor prolyl hydroxylase inhibitors (HIFPHIs) represent a new class of orally administered ESAs. The applicant states the following in the Mechanism of Action section of their proposed roxadustat label:

"Through the inhibition of HIF-PH, roxadustat stimulates a coordinated erythropoietic response that includes the increase of plasma endogenous erythropoietin (EPO) levels, regulation of iron transporter proteins and reduction of hepcidin. This results in improved iron bioavailability, increased hemoglobin production and increased red cell mass."

The applicant hypothesizes that by avoiding the undesirable effects of excess exogenous erythropoietin, roxadustat may have advantages over currently available ESAs, beyond the convenience of an oral dosing form.

Commentary for the Committee

Erythropoiesis stimulating agents are indicated to treat the anemia of CKD based on their ability to increase Hb; however, clinical benefits (i.e., improvements in how patients feel, function, or survive) have not been demonstrated in adequate and well controlled trials. The anemia of CKD has been associated with decreased energy, well-being, and quality of life, as well as cognitive impairment. Although ESAs have been purported to improve these parameters, adequate and well controlled trials have not borne this out. As noted above, sizable randomized trials have attempted to demonstrate that use of ESAs to raise Hb to higher targets improves clinical outcomes, but instead, all have shown (or tended to show) adverse cardiovascular outcomes, leading to limitations on Hb targets as well as a boxed warning, the highest level of warning in product labeling.

ESAs can reduce the need for RBC transfusions, a clear benefit. Although the direct risks of transfusion are now rare (blood-borne infections, transfusion reactions, fluid overload), transfusion avoidance is particularly important in the ESRD population. Importantly, RBC transfusions can cause allosensitization that increases the likelihood of transplant rejection.

The cost of reduced RBC transfusions can be sizable. When ESAs are used to target excessive Hb concentrations, they increase the risk of death, MI, stroke, congestive heart failure, thrombosis of vascular access, and other thrombotic events. They can also cause hypertension and seizures. ESAs also carry warnings for shortened overall survival and increased risk of tumor progression/recurrence in patients with certain malignancies. Given that all of the Hb targeting studies have shown increased cardiovascular risks with higher, rather than lower, Hb targets, it might be assumed that these risks can be reduced by targeting lower Hb values, but it is not known if they can be <u>prevented</u> at <u>any</u> Hb target. No study has identified the optimum Hb target.

In light of these concerns, in 2010, FDA asked the Cardiovascular and Renal Drugs Advisory Committee to opine on whether ESA's indication for the treatment of anemia should be withdrawn in the NDD

patient population. Votes were strongly in favor of continued marketing: 1 "yes," 15 "no," and 1 abstention.

Roxadustat is a first-in-class inhibitor of HIF-PH enzymes. By reducing exposure to intermittent supraphysiologic doses of erythropoietin and improving iron metabolism and availability, the drug was hoped to achieve efficacy at least comparable to ESAs, with fewer safety issues. Moreover, the agent's oral route of administration is unquestionably an important convenience factor for patients who are not on hemodialysis. For patients on hemodialysis, ESAs are recommended to be given by the intravenous route, and the advantage of an oral preparation seems less obvious.

You will discover that roxadustat's efficacy is comparable to that of ESAs; however, there are important risks of serious thromboembolic events, as well as other risks, with roxadustat. Thus, both ESAs and roxadustat have pro-thrombotic effects. This observation raises important questions for discussion. First, how should roxadustat's risks be considered in the context of its benefits? Second, what are the causes of the thrombotic risk that is now observed across classes, and what are the contributing factors? It may help to revisit the questions that arose from the Hb targeting studies [9]. Is the thrombotic risk an on-target effect, mediated through effects on RBC production and related factors, or is it an off-target effect? If the risks are an on-target effect, they may be related to excess Hb concentration, Hb overshoots, excessive rates of Hb rise, rapid fluctuations in Hb, and changes in blood viscosity or volume. Although off-target effects cannot be ruled out, none are known, and, if such effects exist, they must be related to erythropoietin, whether given exogenously (in the case of ESAs) or stimulated indirectly (in the case of roxadustat). Assuming the thrombotic risk is an on-target effect, it seems plausible that less aggressive dosing schemes (e.g., lower starting doses, smaller dose increments during titration, lower Hb targets) could reduce thrombotic risk; however, this has not been established in any randomized controlled study.

We conducted exploratory analyses to elucidate associations between thromboembolic events and roxadustat dose, Hb concentrations, and Hb rates of rise and decline, identical to those undertaken in FDA's 2001 review of the darbepoetin alfa marketing application [10]. In this case, we asked the applicant to corroborate our findings, and they were able to do so. Indeed, higher rates of Hb rise (and decline) were found to be associated with higher rates of thromboembolic events. In light of these findings, the applicant speculates that thromboembolic risks might be reduced through use of a lower roxadustat starting dose. Their prediction seems plausible, but is unproven. Our findings show only associations, without proven cause and effect.

FDA's approval standards state that drugs must be both effective and safe to be approved. Our standards do not state that a drug must be more effective than existing treatment(s) to merit approval, or be safer than existing treatments. Yet when weighing the approval of a new drug, we do consider its benefits and risks in context, including the availability of other therapies. The benefits are difficult to calculate here. The data show that roxadustat decreases the need for RBC transfusions relative to placebo, which is expected and reassuring. The data comparing roxadustat to epoetin alfa with respect to RBC transfusions are less conclusive. And if one believes that the risk of thromboembolic events is greater with roxadustat than ESAs, a critical question is whether lowering the roxadustat starting dose will reduce risk importantly.

The applicant makes the case that ESA hyporesponsiveness in patients with CKD is an important problem in need of better therapies. We agree with this viewpoint; however, the applicant did not generate data showing that patients who are hyporesponsive to ESAs are responsive to roxadustat.

Finally, we note that the roxadustat development program was carried out in two distinct patient populations, with important differences. In the dialysis population, subjects were randomized to roxadustat or epoetin alfa, and subject retention was similar with both treatments. Overall exposure differed by ~11%. Thus, for the purpose of safety analyses, the correction needed for disparate time on study was relatively small, and interpretation of the results of safety analyses is clear-cut.

In the NDD patient population, the applicant carried out placebo-controlled studies in patients who were anemic at baseline, with the possibility of "rescue" therapy if needed. These placebo-controlled studies had the advantage of assessing the safety of roxadustat against a "clean" background; however, many subjects dropped out of the studies, and data from these subjects cannot be considered 'missing at random.' Patients with more advanced disease whose Hb was poorly responsive to the study drug were more likely to leave the study, and experience has shown that such patients are at greater risk of cardiovascular events. As patients who received placebo were more likely to remain anemic, they were more likely to drop out of the study than patients who received roxadustat. Thus, there was a considerable disparity in subject retention between the roxadustat and placebo groups, challenging the interpretation of safety analyses. It seems plausible that the patients who dropped out of the placebo groups in higher numbers were at greater risk of adverse events, yet their time of observation—when they were capable of contributing adverse events—was shortened. Conversely, subjects randomized to roxadustat remained in the studies longer, with greater opportunity to experience adverse events.

Given the above, the assessment of adverse events in the NDD subject population is not straightforward. The results of the analyses depend on how the data were analyzed; specifically, whether the time of observation was limited to the time on-treatment (plus 7 days), extended to last contact (on-study analysis), or truncated at a point between these extremes (e.g., on-treatment plus 28 days). These considerations affect all of the safety analyses, including analyses for MACE.

Draft Points to Consider

The applicant is seeking approval of roxadustat, an oral agent for treatment anemia due to CKD, in adult patients not on dialysis and on dialysis.

Non-dialysis-dependent population:

- 1. Discuss the benefits and risks of roxadustat in the non-dialysis-dependent (NDD) population.
- 2. If you have concerns regarding these risks, discuss whether you believe they could be addressed through modification of the treatment algorithm, for example, changes in target hemoglobin (Hb), starting dose, titration scheme, monitoring paradigm.
 - a. If you favor changes to the treatment algorithm to enhance safety, should they be tested prior to approval?

Dialysis population:

3. Discuss the benefits and risks of roxadustat in the dialysis-dependent (DD) population.

- 4. If you have concerns regarding these risks, discuss whether you believe they could be addressed through modification of the treatment algorithm, for example, changes in target Hb, starting dose, titration scheme, monitoring paradigm.
 - a. If you favor changes to the treatment algorithm to enhance safety, should they be tested prior to approval?
- 5. Should roxadustat be approved for treatment anemia due to CKD, in adult patients not on dialysis?
 - a. If not, provide your rationale, as well as recommendations for additional data and/or analyses that would support a favorable benefit-risk profile and approval of roxadustat.
- 6. Should roxadustat be approved for treatment anemia due to CKD, in adult patients on dialysis?
 - a. If not, provide your rationale, as well as recommendations for additional data and/or analyses that would support a favorable benefit-risk profile and approval of roxadustat.

Evidence of Efficacy

Roxadustat's evidence of effectiveness for the treatment of anemia due to CKD in adult patients is based primarily on six adequate and well-controlled trials.

Non-dialysis dependent (NDD) population: principal studies included three randomized, placebocontrolled, double-blind studies:

- 1517-CL-0608/ALPS (henceforth referred to as "608" in this document)
- FGCL-4592-060/ANDES (referred to as "060" in this document)
- D5740C00001/OLYMPUS (referred to as "001" in this document)

Study 1517-CL-0610/DOLOMITES (referred to as "610" in this document) differed from those above because it employed an active comparator (darbepoetin alfa), was not double-blind, and was conducted solely in Eastern and Western Europe. The study was ongoing at the time the applicant submitted the New Drug Application, and we received the clinical study report early in the review period.

Dialysis-dependent (DD) population: principal studies included 3 randomized, active-controlled (epoetin alfa), open-label studies:

- FGCL-4592-063/HIMALAYAS (referred to as "063" in this document)
- FGCL-4592-064/SIERRAS (referred to as "064" in this document)
- 5740C00002/ROCKIES (referred to as "002" in this document)

Study 1517-CL-0613/PYRENEES (referred to as "613" in this document) provides supplemental information; the study differs from those above because it employed two active comparators (darbepoetin alfa and epoetin alfa), was conducted exclusively in Europe, and permitted use of an ESA that is not licensed in the US.

In light of the safety concerns of the ESAs, the Division has asked sponsors to assess MACE in development programs for drugs for the treatment of anemia of CKD, in both the NDD and DD populations, as noted above. For the NDD indication, studies 608, 001, and 060 were included in a meta-analysis for MACE. For the DD indication, studies 002, 063 and 064 were included in a MACE meta-analyses. Trials 610 and 613 were not considered sufficiently similar to the others to allow inclusion in the meta-analyses.

NDD Indication

Study Designs

The Phase 3 studies for the NDD population are summarized in Table 2. All were multicenter (global), randomized, controlled studies that evaluated the efficacy of roxadustat in correcting Hb. All patients had stage III to V CKD with baseline eGFR < $60 \text{ mL/min/1.73 m}^2$. The primary efficacy endpoint for the US was the mean Hb change from baseline to the mean level during the evaluation period, defined as Week 28 until Week 52. The proportions of subjects with RBC transfusions was a secondary endpoint.

Table 2: Major Trials in the NDD Population

_	Placebo-controlled			ESA-controlled
Design Feature				
	Study 001	Study 060	Study 608	Study 610
Blinding	Double-blind	Double-blind	Double-blind	Open-label
Control	Placebo	Placebo	Placebo	Darbepoetin
Planned Treatment Duration (weeks)	52 - 208	52 - 208	52 - 104	104
Number of Patients	2761	922	594	616
Randomization	1:1	2:1	1:1>2:1	2:1> 1:1
Baseline Hb (g/dL)	< 10.0	≤ 10.0	≤ 10.0	≤ 10.5
Hb target - Correction Period (g/dL)	11.0 ± 1.0	\geq 11.0 and \geq 1.0 from baseline	\geq 11.0 and \geq 1.0 from baseline	\geq 11.0 and \geq 1.0 from baseline
Hb target - Maintenance Period (g/dL)	10.0 - 12.0	10.0 - 12.0	10.0 - 12.0	10.0 - 12.0
Roxadustat starting dose				
(dose given 3 times/week)				
body weight < 70 kg:	70 mg	70 mg	70 mg	70 mg
body weight > 70 kg:	70 mg	100 mg	100 mg	100 mg

Patients with New York Heart Association Class III or IV congestive heart failure (CHF) at enrollment, and patients who had an MI, acute coronary syndrome, stroke, seizure, or a thromboembolic event within 12 weeks prior to randomization were excluded. Patients with uncontrolled hypertension were also excluded. The trials had recommendations for rescue therapy (i.e., iron, ESAs, or transfusion).

The algorithm for dosage adjustments is shown in Table 3. Adjustment was based on the Hb level and the change in Hb over the previous 4 weeks.

Table 3: Roxadustat Dose Adjustment Algorithm for NDD-CKD Subjects

Change in Hb	C				
over Past 4 weeks (g/dL) Correction Period*	Hb < 10.5 g/dL	Hb 10.5-11.9 g/dL	Hb 12.0-12.9 g/dL	Hb≥13.0 g/dL	
<-1.0	1	1	<u> </u>	No change	Hold dosing, check Hb and resume
-1.0 to 1.0	1	1	No change	↓	dosing when Hb <12.0 g/dL, at a dose that is reduced by two dose steps
> 1.0	No change	No change	↓	↓	

Abbreviations: \uparrow = dose increase; \downarrow = dose reduction; Hb = hemoglobin

Source: FibroGen Summary of Clinical Efficacy p. 147

Dose increases and reductions:

- Roxadustat dose increases (\uparrow) and reductions (\downarrow) were intended to be preset according to dose steps: 20, 40, 50, 70, 100, 150, 200, 250, and 300 mg. For example, a dose increase at 70 mg would result in a new dose of 100 mg. A dose reduction at 200 mg would result in a new dose of 150 mg.
- The suggested maximum dose was 3.0 mg/kg or 300 mg per administration, whichever was less.

Dose adjustment for rapid Hb increase:

- For Hb increases >2.0 g/dL in 4 weeks, the dose was to be reduced by one dose step immediately.
- Only one dose reduction for rapid Hb increase was recommended within a 4-week period.

Results

Demographic and Baseline Characteristics: Demographic and baseline disease characteristics were generally well balanced between the two treatment groups for the three trials. The mean age of patients was approximately 63 years. Twenty-one percent of patients were age 75 or greater. A majority of the patients were female (58%). Approximately half the patients were Caucasian, 8% were Black, and 36% were Asian. Most were not on prior ESA treatment. Approximately one-quarter of patients were from the US. More than one-third of patients had a history of cardiovascular, cerebrovascular, or thromboembolic disease. More than 90% of trial participants reported hypertension, and diabetes mellitus was reported as a baseline condition by 37% to 65% of trial participants. The baseline Hb was 9.1 g/dL in both treatment groups. The mean eGFR at baseline was approximately 20 mL/min/1.73 m² for all studies.

Thromboembolic disease, n (%)	30 (2.2)	22 (1.6)	11 (1.8)	3 (1.0)	9 (2.3)	2 (1.0)

Patient Disposition and Discontinuation: For the three studies overall, 62% and 41% of patients randomized to roxadustat and placebo, respectively, completed the treatment period. Decisions to withdraw by either the patient or physician accounted for approximately half of all discontinuations in both groups (Table 5). Discontinuation for ESA rescue therapy was ~4 times higher in patients who received placebo (13.4%) than in roxadustat-treated patients (3.2%). The percentage of patients who discontinued in association with an adverse event(s) was higher among patients treated with roxadustat (6.3%) than in subjects randomized to placebo (4.4%). Deaths were also more frequent in patients randomized to roxadustat (3.4%) than in those randomized to placebo (1.6%).

Table 5: Patient Disposition (NDD Safety Population)

N (%)	Roxadustat (N=2386)	Placebo (N=1884)
Intent-to-treat population	2391	1886
Treated patients	2386 (99.8)	1884 (99.9)
Completed treatment	1485 (62.2)	769 (40.8)
Discontinued treatment early	901 (37.8)	1115 (59.2)
Adverse events	150 (6.3)	83 (4.4)
Death	81 (3.4)	30 (1.6)
Received > 2 courses of ESA rescue therapy	76 (3.2)	252 (13.4)
Lost to follow-up	33 (1.4)	74 (3.9)
Dialysis initiation or kidney transplant	47 (2.0)	20 (1.1)
Physician decision	49 (2.1)	67 (3.6)
Subject decision	250 (11.0)	390 (20.7)
Withdrawal by subject or guardian	144 (6.1)	144 (7.7)
Other	71 (2.9)	55 (2.9)

Drug Exposure: Overall, the duration of study drug exposure was greater in patients treated with roxadustat (mean 84.6 weeks per patient; total 3871 patient-years) than in patients who received placebo (mean 64.3 weeks per patient; total 2323 patient-years). Approximately 71% of roxadustat-treated patients received the drug for > 52 weeks and 34% received it for > 104 weeks. The applicant attributed the higher overall drug exposure in roxadustat-treated patients to the 2:1 randomization ratio (roxadustat:placebo) in the two smaller studies (060 and 608) and the higher dropout rate in patients who received placebo, mainly due to lack of efficacy in all three studies.

Primary Endpoint

As noted above, the primary endpoint in the three principal studies was the mean change in Hb from baseline to the evaluation period (mean value during Weeks 28-52), regardless of rescue therapy, using the intention-to-treat (ITT) analysis set. Efficacy analyses were performed separately for each study. Roxadustat would be considered superior to placebo if the difference in the mean change from baseline between the two treatment groups was statistically significant (p < 0.05) using a multiple imputation analysis of covariance (ANCOVA) method. All three studies demonstrated statistically significant results with respect to change in Hb, and FDA was able to corroborate the applicant's findings (Table 7).

Figure 1 shows the results graphically for the three individual studies as well as the pooled studies. On average, the Hb appears to plateau at target at approximately 12 weeks (~8 weeks in study 608).

Figure 1: Changes in Hb over Time—NDD Studies

Source: FDA analysis

Study 610

Study 610 was a multicenter, European, randomized, controlled trial in patients with NDD-CKD. The study differed from the others in that there was an active comparator (darbepoetin alfa), the study was open-label, and the study was conducted exclusively in Europe. The randomization scheme was initially 2:1 (version one of protocol) but changed to 1:1 (version two).

The starting roxadustat dose was 70 mg for body weight < 70 kg and 100 mg for body weight \geq 70 kg three times a week. Dose titration was conducted based upon the Hb target of 11 ± 1 g/dL. Darbepoetin alfa was dosed subcutaneously or intravenously according to the EU labeling.

The primary efficacy endpoint was the percentage of Hb responders during the first 24 weeks of treatment. A responder was defined as a subject who attained a Hb response as follows:

- Hb≥11.0g/dL and an increase from baseline ≥ 1.0g/dL (subjects with baseline Hb > 8.0g/dL); or
- An increase from baseline $\geq 2.0 \,\text{g/dL}$ (subjects with baseline Hb $\leq 8.0 \,\text{g/dL}$)

Patients receiving rescue therapy were non-responders.

Noninferiority was to be declared if the lower bound of the two-sided 95% CI was > -15%. The primary endpoint was to be analyzed using the Per Protocol Analysis set, consisting of all randomized patients who received \geq 1 dose of study drug, had \geq 1 post-dose Hb assessment, and did not meet any exclusion criteria.

Demographic and baseline disease characteristics were comparable between the two treatment groups (Table 8). Mean age was 66 years. The majority of patients were Caucasian (95%), and approximately 56% were women. Approximately 30% were from Western Europe, with 70% from Eastern Europe. In both treatment groups, the mean baseline Hb was $9.55 \, \text{g/dL}$ and the mean baseline eGFR was $20.3 \, \text{mL/min/1.73 m}^2$. Just under half of all patients had a history of cardiovascular, cerebrovascular, or thromboembolic disease.

Table 8: Selected Demographic and Baseline Disease Characteristics—Study 610

	Treatment Groups		
	Roxadustat (N=323)	Darbepoetin (N=293)	
Age in years mean (SD)	66.8 (13.6)	65.7 (14.4)	
Female, n (%)	178 (55.1%)	164 (56.0%)	
Race, n (%)			
Caucasian	306 (94.7%)	281 (95.9%)	
Black	8 (2.5%)	2 (0.7%)	
Asian	9 (2.8%)	10 (3.4%)	
Baseline eGFR (mL/min/1.73m²) (SD)	20.3 (11.5)	20.3 (10.7)	
Baseline Hb mean (SD)	9.55 (0.75)	9.55 (0.69)	
Baseline iron replete, n (%)	182 (56.3%)	152 (51.9%)	
Diabetes, n (%)	150 (46.5%)	137 (46.7%)	
History of cardiovascular,			
cerebrovascular, or thromboembolic	152 (47.1%)	142 (48.5%)	
disease, n (%)			

Patient Disposition and Discontinuations

Study retention was similar in the two treatment groups: 22.9% of patients in the roxadustat group vs. 19.8% in the darbepoetin alfa group withdrew before the Week 24 cutoff. The most frequent reasons for discontinuation in the roxadustat group were withdrawal by patient (9.9%), death (8.4%), and adverse events (6.5%). The most common reasons for discontinuation in the darbepoetin group were death (10.2%), withdrawal by patient (6.8%), and adverse event (2.7%).

Efficacy Endpoint

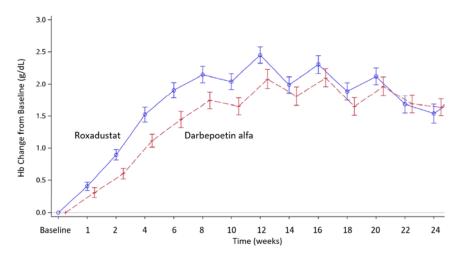

For the per-protocol analysis set, 89.5% of patients in the roxadustat group vs. 78.0% in the darbepoetin alfa group were responders (Table 9). The difference in proportions was 11.5%, favoring roxadustat, and the 95% CI of the response rate difference excluded -15%, meeting the study's efficacy objective.

The changes in Hb are shown graphically in Figure 1. Although the rate of Hb rise was not evaluated as a study endpoint, a trend showing more rapid Hb increase in the roxadustat group is clearly evident, which may have ramifications for safety.

Table 9: Efficacy Results for Trial 610 (Ns Represent Numbers in the Per-protocol Analysis Set)

	Roxadustat	Darbepoetin alfa	
	N=286	N=272	
Number of responders	256 (89.5%)	213 (78.0%)	
95% CI	(85.4%, 92.8%)	(72.6%, 82.8%)	
Difference of proportions (roxadustat – darbepoetin alfa)	11.5%		
95% CI of difference	(5.66%, 17.36%)		

Figure 2: Hb Change from Baseline by Time (mean ± 95% CI)—Study 610 (figure adapted from applicant)

DD Population

Study Designs

Roxadustat's efficacy for the treatment of anemia in adult patients with DD-CKD is supported by three randomized, active controlled, non-inferiority trials: 002, 063, and 064. These were similarly designed, open-label studies where subjects were randomized 1:1 to roxadustat or epoetin alfa. All subjects had Stage 3 to 5 CKD with a baseline Hb level < 10 g/dL (if not on an ESA) or < 12 g/dL (if on an ESA). All trials excluded patients with New York Heart Association Class III or IV CHF at enrollment, and patients with a history of MI, acute coronary syndrome, stroke, seizure, or thrombotic event within 12 weeks prior to enrollment. Patients with uncontrolled hypertension were also excluded. The intended duration was ≥ 52 weeks. The trials had recommendations for rescue therapy using ESAs or transfusion in the roxadustat group and transfusion in the epoetin alfa group. The roxadustat dose was titrated to achieve a Hb target of 10.0 to 11.0 g/dL in the US and 10.0 to 12.0 g/dL outside the US. The primary endpoint for the three studies was the mean change in Hb from baseline to Weeks 28 to 52, regardless of rescue therapy. Having determined the mean treatment effect in both groups, non-inferiority (NI) of roxadustat to epoetin alfa was to be declared if the lower bound of the 95% CI of the inter-group difference

(roxadustat - epoetin alfa) was greater than the pre-defined NI margin -0.75 g/dL, i.e., the 95% CI excluded a difference of 0.75 g/dL or more. The proportions of subjects with RBC transfusions was a secondary endpoint. Major design features are summarized in Table 10.

Study 002 enrolled patients with ESRD who were receiving, or had initiated, hemodialysis or peritoneal dialysis at least 30 days prior to enrollment. Amendment #6, designed to increase enrollment of US patients with incident dialysis, changed the dialysis criterion to receiving at least 2 weeks and not more than 4 months. At enrollment, subjects could be on an ESA (with Hb <12.0 g/dL) or not on an ESA (with Hb <10 g/dL). For patients not on an ESA, the roxadustat starting dose was 70 mg orally thrice weekly regardless of body weight; for patients on an ESA, the starting dose was calculated on the basis of the ESA dose (range: 70 to 200 mg thrice weekly).

Study 063 enrolled patients with CKD and incident dialysis (2 weeks to 4 months prior to randomization), with baseline Hb \leq 10 g/dL. The roxadustat starting dose was 70 mg for body weight < 70 kg and 100 mg for body weight \geq 70 kg, thrice weekly.

Study 064 enrolled subjects who were on a stable ESA dose \geq 4 weeks prior to and during screening, with an allowable Hb range of 8.5 to 12.0 g/dL. Amendment #1 and #2 encouraged the enrollment of more patients considered to have incident dialysis as defined for Study 063. The starting roxadustat dose was 70 to 200 mg thrice weekly, calculated on the basis of the prior ESA dose.

Only Study 063 enrolled exclusively incident dialysis. The other studies amended their protocols to enroll incident dialysis and planned to later compare results between incident and stable dialysis subgroups. Incident dialysis did not have a standard definition. Because of the multiple amendments and lack of a standardized definition, FDA did not further analyze this subgroup.

Study 613, described separately, was conducted in Eastern, Central, and Western Europe, and used both darbepoetin alfa and epoetin alfa as comparators. Use of an ESA, approved in the EU but not licensed in the US, was permitted.

Results

Demographics & Baseline Disease Characteristics

The demographics and baseline disease characteristics for all three trials were generally balanced between the two groups. Overall, approximately 45% of patients were enrolled in US sites. Meanage

 $[\]S$ 10.0 to 11.0 g/dL in the US; 10.0 to 12.0 g/dL outside the US

ID-DD = incident dialysis; SDD = stable dialysis-dependent

was 54 to 58 for all studies. At baseline, most patients were male (58%), White (varied by study), on prior ESA treatment, and on stable dialysis. Study 064 was conducted solely in the US, and 42% of participants were Black. More than 90% of trial participants reported hypertension as a baseline medical condition. Diabetes mellitus was reported as a baseline condition by 28% to 65% of trial participants. Overall, about half of the subjects had a history of cardiovascular, cerebrovascular, or thromboembolic disease. The mean baseline Hb was similar between the two groups, averaging 9.6 g/dL over the three studies. Overall, approximately, 90% of patients in both treatment groups were receiving hemodialysis, and the rest were receiving peritoneal dialysis.

Patient Disposition

Of 3890 patients randomized, 3880 were treated (roxadustat = 1940; epoetin alfa = 1940). Treatment completion rates were 58.5% and 66.3% in the roxadustat and epoetin alfa groups, respectively, and reasons for discontinuation are shown in Table 13. Discontinuations were disproportionately higher in the roxadustat group for adverse events, death, and the need for ESA rescue therapy.

Table 13: Patient Disposition DD Safety Population (002, 063, 064)

N (%)	Roxadustat	Epoetin Alfa
	(N=1940)	(N=1940)

Drug Exposure

Figure 3 shows the differential retention of subjects in the roxadustat and ESA groups for the three studies. As predicted by the figure, the mean duration of study drug exposure was shorter in patients randomized to roxadustat (89.2 weeks) than to epoetin alfa (100.7 weeks). Total durations of exposure were 3315 and 3744 patient-years, respectively. The percentages of patients who received the study drug through Week 52 (the end of the assessment period for the primary endpoint) were 63% for roxadustat and 71% for epoetin alfa.

Figure 3: Subject Retention for the DD Population—Studies 002, 063, 064

> 52 Weeks	1223 (63.0)	1370 (70.6)
> 104 Weeks	831 (42.8)	1010 (52.1)
> 156 Weeks	302 (15.6)	385 (19.8)

Primary Endpoint

All three studies demonstrated non-inferiority of roxadustat vs. epoetin alfa (Table 15), as the lower bound of the 95% CI of the treatment difference (roxadustat - epoetin alfa) exceeded the prospectively-defined NI margin of -0.75 g/dL. Statistically significantly fewer subjects received RBC transfusions in the roxadustat group than in the epoetin alfa group in Study 064; however, Studies 002 and 063 showed opposite trends (Table 15). Moreover, it is important to recognize that the transfusion data are confounded. Subjects who were randomized to roxadustat could receive ESAs or RBC transfusions as a rescue therapy, whereas subjects who were randomized to epoetin alfa could receive only a transfusion as rescue therapy. Thus, it cannot be concluded that subjects who received roxadustat required fewer RBC transfusions than subjects who received epoetin alfa.

Study 613

Study 613 (Pyrenees) was a randomized, open-label, non-inferiority trial in patients with DD-CKD on stable hemodialysis or peritoneal dialysis for ≥ 4 months and on stable ESA treatment for ≥ 8 weeks. The study was conducted at multiple sites in Eastern, Central, and Western Europe. Patients were randomized 1:1 to roxadustat or continued treatment with their prior ESA: darbepoetin alfa or epoetin alfa. (Of note, randomization was not stratified by prior ESA.) Use of an ESA, approved in the EU but not licensed in the US, was permitted. Eligible patients were required to have a baseline Hb between 9.5 and 12.0 g/dL. The US primary efficacy endpoint was the change in Hb from baseline to the mean level during the evaluation period (weeks 29 through 52), regardless of rescue therapy. Hypothesis testing was conducted with a NI margin of -0.75 g/dL as it was for Studies 002, 063, and 064: i.e., NI would be declared if the 95% CI of the difference excluded 0.75 g/dL or more.

The starting dose of roxadustat was based on the previous ESA dose and the protocol provided for adjusting the roxadustat dose to maintain Hb between 10 and 12 g/dL.

Study Patients: Enrolled patients were randomized to roxadustat (n=415) or continued ESA treatment (n=422) for an intended treatment duration of \geq 52 weeks (\leq 104 weeks). Approximately 62% of patients had been using epoetin alfa, and approximately 38% had been using darbepoetin alfa.

Demographics and Baseline Characteristics: The demographics and baseline characteristics were generally well balanced between the two groups. The mean age of patients was approximately 61 years. Most patients were male (58%), White (97%), and on hemodialysis (94%). Mean baseline Hb values were approximately 10.8 g/dL in both groups, and the majority of patients were iron replete at baseline.

Study completion rates were 60% in the roxadustat group and 73% in the ESA group. Deaths occurred in 14.9% of subjects in the roxadustat group vs. 11.2% of subjects in the ESA group.

Table 16: Selected Demographic and Baseline Disease Characteristics—Study 613

	Roxadustat (N=415)	Continued ESA Treatment (N=422)
Age, mean (SD)	61 (13.8)	61.8 (13.4)
Female, n (%)	169 (40.8)	285 (44)
Race, n (%)		
White	405 (97.8)	407 (96.9)
Black	6 (1.4)	6 (1.4)
Asian	1 (0.2)	3 (0.7)
Other	2 (0.5)	4 (1.0)
Hemodialysis, n (%)	379 (91.5)	405 (96.4)
Peritoneal Dialysis, n (%)	35 (8.5)	15 (3.6)
Baseline Hb (g/dL), mean (SD)	10.75 (0.62)	10.77 (0.63)
Diabetes, n (%)	104 (25.1)	133 (31.6)
History of cardiovascular, cerebrovascular, or thromboembolic disease, n (%)	169 (40.8)	201 (47.9)

Efficacy Endpoint

For the primary endpoint of Hb change from baseline averaged over Weeks 28 to 52 regardless of rescue therapy, the study met the noninferiority margin of -0.75 g/dL. The least squares mean difference between roxadustat vs. ESA in the ITT was 0.17 (95% CI: 0.082, 0.26) with p < 0.001 (one-sided).

Safety

Safety is divided into four sections: (1) analyses of adverse events; (2) analyses of laboratory data; (3) analyses of MACE; and (4) explorations of the relationships between thromboembolic events, drug dose, Hb concentration, and rate of change of Hb concentration. In each section, data for the NDD and DD patient populations are presented sequentially. All of these analyses contribute importantly to the assessment of roxadustat's safety.

Studies in the NDD patient population are placebo-controlled. Consequently, they offer the opportunity to assess the safety of roxadustat against a "clean" background. On the other hand, these studies suffer from disparate rates of discontinuation in two treatment groups. As noted above, patients who were doing poorly, some of whom required RBC transfusions, were more likely to discontinue from treatment and discontinue from the study, such they could no longer contribute adverse events. It follows that adverse event rates are dependent on time of observation. Even when adjusted for observation time, the results may be somewhat skewed against roxadustat. Thus, smaller differences in adverse event rates between the roxadustat and placebo groups in the NDD population may be factitious and should be interpreted carefully. (Larger differences, in contrast, merit concern.) In the DD population, studies

were active-controlled (against epoetin alfa) and rates of discontinuation were similar; therefore, interpretation of adverse event rates in this population is straightforward.

Analyses of Adverse Events

Methods

Pooling: Given that the three studies in the NDD population were similar in terms of their patient populations, durations, and Hb targets, simple pooling was used to combine them for the main safety analyses. Of note, however, the randomization ratios differed across the studies (1:1 in study 001, 2:1 in studies 060 and 608), and the studies differed in size, leading to the potential for Simpson's paradox. Nevertheless, we found that the signals that emerged from the pooled analyses were generally consistent across the individual studies.

Definition of "Treatment-emergent": A "treatment emergent" adverse event is defined as an adverse event that was not present prior to treatment but occurs during treatment (or, if present at treatment initiation, an event that worsens in intensity or frequency on-drug). Only treatment-emergent adverse events are considered in this document, as is customary.

Ascertainment Window: When patients are monitored after treatment discontinuation, it is essential to define the "ascertainment window"—the time on-treatment plus the interval of additional monitoring beyond which a causal relationship between the drug and effect would not be reasonably likely. Typical ascertainment windows are the treatment period plus 5 half-lives; however, in many cases, a week or a month are selected—somewhat arbitrarily.

Establishment of the ascertainment window requires careful consideration. For example, alpha1 adrenoreceptor blocking agents would not be expected to cause orthostatic hypotension once they are no longer in the circulation. In contrast, some drugs have the potential to cause long-term sequelae, e.g., pulmonary fibrosis. Thus, it is important to define the ascertainment window, and this is usually done prospectively.

The applicant conducted analyses based on multiple ascertainment windows: on-treatment plus 7 days (OT+7), on-treatment plus 28 days (OT+28), and on-treatment plus all (OT+All), i.e., On-Study. Although longer "windows" have the potential to detect adverse events with longer latency, they also have greater potential for confounding. (For example, some patients initiated other treatments for anemia after discontinuing the study drug that could confound analyses using longer ascertainment windows.) Thus, results for all three "windows" were considered in some of our analyses and are considered complementary. More detail is provided in the section on MACE.

Adverse Event Queries: Study investigators report adverse events using their own language, i.e., 'verbatim terms,' which must be translated into appropriate, standard preferred terms prior to analysis. For example, the verbatim term 'hypotension w/ sepsis from pneumococcus' would be translated to the standard preferred term 'pneumococcal sepsis.'

Verbatim terms can include substantial detail, and disparate but related terms must be combined in order to represent the various safety signals completely and accurately. Thus, the terms 'wound sepsis,' 'neutropenic sepsis,' 'urosepsis,' 'septic shock,' etc. all indicate 'sepsis' and need to be combined. The combination of medically similar and/or related preferred terms for analysis is called a "query." To be

clear, tabulation of individual preferred terms <u>without</u> queries can be highly deceptive. For example, the adverse event term 'sepsis' was reported for 81 patients who received roxadustat in the NDD population, whereas a query for 'sepsis,' including multiple additional adverse events, finds 132 patients. The preferred terms used in some of the more important queries are shown in the appendix.

Standardized MedDRA queries have been available for many years; however, they are not well suited for assessing adverse events in new drug applications. For this reason, FDA is developing a standard set of queries for new drugs. FDA's new queries, as well as other queries developed over many years by FDA staff, were used to assess the adverse events in the roxadustat development program.

Event rate: In the analysis of adverse events, event rates are reported per 100 patient years (P-Y). These calculations include only the incident event (i.e., recurrent events are not counted) and utilize an overall total exposure (dependent upon the ascertainment window applied) across the set of adverse events. In other words, for subjects who experienced an adverse event, follow-up time was not censored after the event in these analyses. For patients who experienced a particular adverse event, the applicant truncated the time of exposure at the time of event (in some analyses). This is a reasonable approach that differs slightly the approach we used; however, the differences in calculated patient exposure are minimal, with essentially no effect on the results.

Drug-relatedness: The most important consideration when assessing adverse events in the consideration of drug safety is relatedness. Merely identifying a risk difference in an adverse event that disfavors a drug does not constitute causality. In our formulation of causality, we considers a drug's mechanism of action, non-clinical (animal) findings, known effects of other drugs in-class, relationship of the adverse event to dose/exposure, consistency of signals in studies across a development program, and consistency across related adverse events (e.g., signals for orthostatic hypotension and falls are self-reinforcing). Finally, consistency between the total numbers of adverse events and serious adverse events can be important, and may play an important role in considering the overall benefit-risk profile.

Results

NDD Patient Population

The NDD patient population included all 4270 randomized subjects who received ≥ 1 dose of study drug in the three major randomized, double-blind, placebo-controlled studies (001, 060, 068). No subjects were on dialysis at the time of randomization, although some initiated dialysis during the study. Some of the adverse events are relatively specific to hemodialysis (e.g., vascular access thrombosis) or peritoneal dialysis (e.g., peritonitis); however, the actual denominators (i.e., numbers of subjects) are unknown. Thus, although the relative risks of such events may be accurate, their absolute risk differences will be underestimated. Analyses are shown separately for Study 610, which employed an active control group instead of a placebo group.

Deaths

Causes of death were adjudicated by an independent event committee and are summarized in Table 17, as reported by the applicant. Their analysis is based on the OT+28 ascertainment window. The "Patients with Events" columns list the numbers of subjects along with the corresponding percentages of patients. As noted above, however, the mean and total time-on-study differed between the roxadustat and placebo groups; therefore, expression of a simple frequency of adverse events (% of patients) is

potentially misleading. The "Events per 100 P-Y" columns (P-Y = patient-year) is corrected for duration of treatment, and provides a more appropriate basis for comparison between the treatment groups. The "Risk Difference" column (red bars) shows the absolute risk difference between the roxadustat and placebo groups, and represents a simple subtraction expressed per 100 P-Y. The "Relative Risk" column (blue bars) is the ratio of the risks (roxadustat/placebo) based on events per 100 P-Y.

Infection	55 (2.31)	16 (0.85)	1.36	0.65	0.71	2.09
Renal	44 (1.84)	16 (0.85)	1.1	0.7	0.44	1.68
Malignancy	6 (0.25)	2 (0.11)	0.15	0.08	0.07	1.83
Hemorrhage	5 (0.21)	3 (0.16)	0.12	0.12	0.00	1.02
Undetermined	27 (1.13)	13 (0.69)	0.67	0.53	0.14	1.27

Data are compliled from Table 50 in the applicant's Integrated Summary of Safety; P-Y = patient-year

The rate of death was higher in patients who had received roxadustat; the overall risk difference was 1.48 deaths per 100 P-Y, with a relative risk of 1.30. Somewhat fewer than half the deaths were cardiovascular in nature. The leading causes of death (and the largest contributors to the risk difference) were infections, "renal" deaths, and sudden cardiac deaths. Deaths will be discussed in greater detail in the MACE section. The numbers of adjudicated deaths from malignancy are small, but there are more deaths from malignancy in patients who received roxadustat (estimated relative risk = 1.8). Malignancy is of interest because it is a labeled adverse drug reaction for the ESAs.

Deaths in Study 610

In this study of 616 subjects, there were 22 (6.8%) and 18 (6.1%) deaths in the roxadustat and darbepoetin alfa groups, respectively, in the OT+28 analysis. For the On-study analysis, there were 29 (9.0%) and 22 (7.5%) deaths in the respective groups. The numbers of deaths were greater in the roxadustat group, but the difference is too small to be conclusive.

Serious Adverse Events

Table 18 shows the serious adverse events and adverse event queries for the pooled studies in the NDD patient population for the OT+7 ascertainment window. The tabulation (and many that follow in this document) shows a mixture of serious adverse event queries and individual serious adverse event preferred terms, with the later denoted by "term or "actual term." Subjects with more than one serious adverse event for a given preferred term or more than one event within the same query were counted only once.

Adverse events and adverse event queries for which the event rate (per 100 P-Y) is \geq 0.5 with a relative risk \geq 1.3 are shown, along with adverse events of special interest.

Table 18: Serious Adverse Events—Studies 001, 060, and 608; Ascertainment Window OT+7

	Patients with events (%)		Events (per 100 PY)		Risk	
	Roxadustat	Placebo	Roxadustat	Placebo	Difference	Relative Risk Based on P-Y

Malignancy FDA	37 (1.55)	23 (1.22)	0.96	0.99	0.0	0.97

Listings labeled "term" represent individual preferred terms.

All other listings represent queries that combine multiple, related adverse event terms.

FDA = FDA query; P-Y = patient-year

Given the problem of differential dropout from the two treatment groups, relative risks less than ~1.3 seem difficult to interpret. The ESAs are known to increase the risk of thrombotic events, and they are listed as adverse drug reactions in their labeling. Roxadustat also shows an obvious signal for serious thrombotic events, with an estimated risk difference (vs. placebo) of 1.1 events per 100 P-Y and a relative risk of 1.45. The largest contributors to the thrombosis query are MI, with 54 events in the roxadustat group, and stroke with 53 events. The numbers of subjects with deep vein thrombosis and pulmonary embolism are relatively small; however, the relative risks are concerning: 6.0 and 4.8, respectively. Importantly, as noted above, the risk difference for device/shunt thrombosis is considerably underestimated, because the analysis assumes that all patients were on dialysis, which is untrue. (Fortunately, additional estimates of the risk of device/shunt thrombosis are available from studies in the DD patient population, shown later, where all subjects are on dialysis and the denominators are certain.)

Seizure is another serious adverse event of special interest, as seizures are an adverse drug reaction with ESAs. Although the numbers of subjects with serious adverse events of seizure are relatively small, the relative risk of 5.4 merits concern (9 vs. 1 event).

The signal of serious infection was unexpected, but sepsis/septic shock is an obvious concern (risk difference 1.3 per 100 P-Y; estimated relative risk = 2.37), and it is reinforced by signals for serious urinary tract infections, bacterial infections, cellulitis, and peritonitis. Again, as noted above, it is safe to assume that most subjects who reported peritonitis were on peritoneal dialysis. Although the relative risk of peritonitis may be reasonably accurate, the risk difference may be underestimated here.

Other notable serious adverse events include acute kidney injury, hyperkalemia, fracture, gastrointestinal hemorrhage, and hyponatremia.

One might reasonably ask whether some serious adverse events were more common in the placebo groups than in the roxadustat groups. Queries for pulmonary edema, anemia, angina, fatigue, hypotension, and dyspnea favored roxadustat, with event rates exceeding 0.5 per 100 P-Y in the placebo groups (≥ 11 events) and relative risks < 0.75.

Study 610

Unlike the placebo-controlled studies above, Study 610 employed darbepoetin alfa as an active comparator, and time-on-treatment was similar between the two groups. Thus, serious adverse events are expressed as simple percentages, without correction for time-on-study. Of note, the total number of subjects in Study 610 was $^{\sim}1/7$ the number of subjects in the three pooled studies.

Table 19 shows serious adverse events (and queries) where the frequency in the roxadustat group was > 5% and the relative risk vs. darbepoetin alfa exceeded ~1.3. Note: the threshold for inclusion of serious adverse events in this table differed from the threshold for the pooled analyses of Studies 001, 060, and 608; however, they correspond to similar numbers of adverse events in roxadustat-treated groups.

¹ The list of adverse event terms in the query is shown in the appendix.

Signals for both serious thrombosis and infection events are again apparent. The thrombosis difference is particularly important because it is evident when compared here to darbepoetin alfa, which is itself known to predispose to thrombotic events.

Table 19: Serious Adverse Events—Study 610

	Roxadustat N = 323	Darbepoetin alfa N = 293	Risk Difference (%)	Relative Risk
N (%)				
Infection, all	48 (14.9%)	34 (11.6%)	3.3	1.28
Bacterial infectious disorders	18 (5.6%)	7 (2.4%)	3.2	2.33
Pneumonia FDA	19 (5.9%)	12 (4.1%)	1.8	1.44
Thrombosis	20 (6.2%)	13 (4.4%)	1.8	1.41

All listing are queries; FDA = FDA query

One might reasonably question whether there were serious adverse events that occurred at a frequency of 5% in the darbepoetin group with a relative risk favoring *roxadustat*. The frequencies for congestive heart failure (query) were 5.0% and 7.5% in subjects treated with roxadustat and darbepoetin alfa, respectively. No other serious adverse events (or queries) were found that favored roxadustat over darbepoetin alfa.

All Adverse Events

Table 20 lists the results of pooled analyses of adverse events and adverse event queries for the three major studies in the NDD patient population, where the event rate was > 2 per 100 P-Y in the roxadustat groups, and the relative risk (vs. placebo) was > 1.2. This listing of \underline{all} adverse events includes the serious adverse events described above.

Table 20 is similar to the previous table, with the addition of estimated relative risks for all ascertainment windows. The heights of the vertical violet bars at right represent the estimated relative risks for the OT+7, OT+28, and OT+All (On-Study) analyses, respectively. Thus, the height of the violet bar at left corresponds to the relative risk for the OT+7 analysis, which matches the relative risk in the column 'Relative Risk Based on P-Y.' The center and right violet vertical bars show the results for the OT+28 and on-study analyses. Inspection of the three violet bars for each listing shows how the risk ratios differ across the ascertainment windows. The relative risks are fairly consistent across the OT+7, OT+28, and On-study ascertainment windows for most of these adverse events. Device/shunt thrombosis/occlusion and sepsis/septic shock are exceptions, where the relative risk decreases somewhat for the OT+All ascertainment window.

Again, there are notable signals for thrombotic events, sepsis/septic shock, bacterial infections, seizures, and hyperkalemia. There is a signal for face edema with a small number of events, but a substantial relative risk (8.4). There are signals for insomnia, rash, peripheral edema, acute kidney injury, and fracture; however, the risk differences are small. Peripheral edema and the query 'edema, fluid retention overload' show risk differences around 1 per 100 P-Y range, and are risks of ESAs. Nausea, vomiting, and dyspepsia all have estimated relative risks of 1.2 with risk differences ~1 per 100 P-Y, and the fact that they were detected together suggests drug-relatedness. Malignancy is neutral.

Case 3:21-cv-02623-EMC Document 111 Filed 01/14/22 Page 812 of 1730

FDA Roxadustat Briefing Document: Roxadustat; NDA 213805

Considering the large number of adverse events and queries examined, it is reasonable to consider whether there are signals that favored *placebo*. The only adverse events reported at a rate > 2 per 100 P-Y in patients who received placebo with a relative risk < 0.8 (i.e., worse in the placebo groups) were anemia, asthenia, fatigue, hypotension, and myocardial ischemia.

Table 20: All Adverse Events—Studies 001, 060, and 608; OT+7, OT+28, and OT+All Ascertainment Windows

[&]quot;FDA N" = FDA query; P-Y = patient-year; RR = relative risk

Study 610

Table 21 shows all adverse events and adverse event queries that were reported at a frequency of > 5% in the roxadustat group, and > 2% higher than in the darbepoetin alfa group in Study 610. (As previously noted, roxadustat was compared to darbepoetin alfa in this study rather than placebo, and time-on-treatment was similar between the two treatment groups.)

Table 21: All Adverse Events—Study 610

	Roxadustat	Darbepoetin alfa	Risk	Relative
	N = 323	N = 293	Difference (%)	Risk
N (%)				
Hyperphosphatemia (term)	23 (7.1%)	9 (3.1%)	4.0	2.29
Edema, fluid retention, overload	62 (19.2%)	45 (15.4%)	3.8	1.25

Hypotension FDA	17 (5.3%)	9 (3.1%)	2.2	1.71
Bronchitis (term)	20 (6.2%)	12 (4.1%)	2.1	1.51

Adverse events denoted by "term" are individual preferred terms. All others are queries. FDA = FDA query

Signals for peripheral edema, edema, fluid retention/overload, insomnia, thrombosis, and nausea have been observed in other studies, and their observation here is reinforcing. In particular, thrombosis and fluid retention/overload are labeled adverse drug reactions for ESAs. Adverse events not heretofore observed include hyperphosphatemia, muscle spasms, dyspnea, arrhythmia, constipation, headache, hypotension, and bronchitis. Analyses of adverse events in the DD patient population will provide a far more robust comparison between roxadustat and darbepoetin alfa.

DD Patient Population

The DD patient population includes 3880 randomized subjects who received ≥ 1 dose of study drug in the three major randomized, double-blind, active-controlled studies (002, 063, 064). Study 063 enrolled subjects who had initiated dialysis within 4 months of randomization. Studies 002 and 064 enrolled such subjects, as well as subjects who had been stable on dialysis and were using an ESA. Subjects were randomized to roxadustat or epoetin alfa. Analyses are shown separately for Study 613, which was conducted in Europe and included randomization to either roxadustat or darbepoetin alfa. Because ESAs were used as active controls for these trials, the adverse event tables include most of the adverse drug reactions currently in the ESA labels.

Deaths

Table 22 provides a tabulation of adjudicated deaths in the DD patient population, with numbers compiled from the applicant's table. There is a slight trend toward a higher rate of death in patients who received roxadustat vs. epoetin alfa. The risk difference was 0.62 deaths per 100 P-Y, with a relative risk of 1.08. Slightly more than half the deaths were cardiovascular in nature. The leading causes of cardiovascular death (and the largest contributors to the risk difference) were acute MI and sudden cardiac death. The leading non-cardiovascular causes of death were infection and "renal" deaths. Deaths will be discussed in greater detail in the MACE section.

Table 22: Adjudicated Causes of Death—Studies 002, 063, 064; Ascertainment Window OT+28

	Patients with events		Events (pe	er 100 PY)

Undetermined	22 (1.13)	31 (1.6)	0.64	0.80	-0.16	0.80

Data are complifed from Table 117 in the applicant's Integrated Summary of Safety; P-Y = patient-year

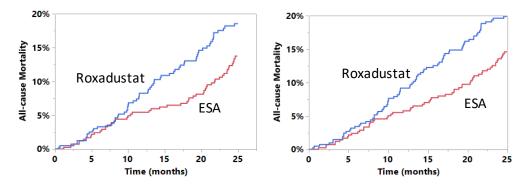

Deaths in Study 613

Study 613 was a European study that randomized stable DD subjects 1:1 to roxadustat (N = 414) or ESA (N = 420). According to the applicant, within the OT+28 ascertainment window, there were 64 (9.7 per 100 P-Y) and 51 (6.8 per 100 P-Y) all-cause deaths in the roxadustat and ESA treatment groups, respectively. The applicant's estimated HR is 1.588 (95% CI 1.096, 2.300); P = 0.015. The risk difference is 2.9 deaths per 100 P-Y.

For the On-study analysis, there were 78 (10.6 per 100 P-Y) vs. 59 (7.4 per 100 P-Y) deaths for the roxadustat and ESA groups, respectively. The applicant's estimated HR was 1.562 (95% CI 1.112, 2.195); p = 0.010. The risk difference is 3.2 deaths per 100 P-Y.

Kaplan-Meier survival curves are shown for the OT+28 and On-study analyses in Figure 4, left, and right. In accord with the applicant's analyses, the log-rank p-values are nominally statistically significant in these unadjusted Kaplan-Meier analyses. Causes of death were not adjudicated, and no predominant causes were apparent based on the preferred terms of adverse events that were cited as leading to death.

Figure 4: Kaplan-Meier Curves for Time to Death—Study 613, OT+28 (left); On-study (right)

Serious Adverse Events

Table 23 shows the serious adverse events and serious adverse event queries for the pooled studies in the DD patient population (OT + 7 ascertainment window). Events and queries are shown for those where the event rate (per 100 P-Y) is \geq 0.5 and the relative risk \geq 1.3, along with adverse drug reactions from the ESA labeling.

Table 23: Serious Adverse Events—Studies 002, 063, and 064; OT+7 Ascertainment Window

	Patients with Events N (%)		Events (per 100 PY)		Absolute ∆ Risk	Relative Risk
	Roxadustat	ESA	Roxadustat	ESA	(per 100 P-Y)	Based on P-Y
	N = 1940	N = 1940	3315 P-Y	3744 P-Y

Rash FDA	2 (0.1)	2 (0.1)	0.06	0.05	0.01	1.1

All listed adverse events are queries except those denoted by "term," which are individual preferred terms. FDA = FDA query; P-Y = patient-year

Serious thrombotic events and seizures are again prominent. In the NDD patient population, they were detected against a placebo background; importantly, here they are evident even against epoetin alfa, which is itself known to pose these risks. Other signals of concern include serious adverse events of hypoglycemia, gastroenteritis, and pancreatitis.

Many of the adverse drug reactions known for ESAs (Table 23, bottom) are low in frequency and the results are uninterpretable. For the more frequent serious adverse events that are listed as adverse drug reactions for ESAs (e.g., systemic hypertension and edema, fluid retention/overload), event rates with roxadustat are similar to those for epoetin alfa, which would support including them in roxadustat's labeling if the drug is approved. For MI, the relative risk is 1.2. Myocardial infarction will be discussed in detail in the MACE section.

Study 613

Table 24 shows the serious adverse events in that occurred at a frequency > 5% in the roxadustat group with a relative risk (vs. ESAs) that exceeded 1.3. As has been mentioned previously, thrombosis of vascular access is listed as an adverse drug reaction in the ESA labeling (as a warning). The risk of congestive heart failure is also listed as an adverse drug reaction when ESAs are used to target excessive Hb concentrations. Thus, these signals from Study 613 are quite concerning (both with a relative risk of 2 vs. ESAs), because they suggest that roxadustat's risks are even greater than those of ESAs. Moreover, serious bacterial infections were more frequent with roxadustat than with the ESAs, also as noted in studies in the NDD patient population where roxadustat was compared to placebo. Serious adverse events consistent with other adverse drug reactions from the ESA label were infrequent (not shown).

Table 24: Serious Adverse Events—Study 613

N (%)	Roxadustat N = 414	ESA N = 420	Di	Risk fference (%)	Relative Risk
Congestive heart failure	31 (7.5%)	16 (3.8%)	3.7		2.0
Arteriovenous fistula thrombosis (term)	29 (7%)	15 (3.6%)	3.4		2.0
Device/shunt thrombosis	35 (8.5%)	22 (5.2%)	3.3		1.6
Bacterial infectious disorders	23 (5.6%)	16 (3.8%)	1.8		1.5
Thrombosis	52 (12.6%)	43 (10.2%)	2.4		1.2

All listed adverse events are queries except those denoted by "term," which are individual preferred terms.

All Adverse Events

Table 25 lists all adverse events in the three principal studies in the DD patient population where the adverse event rate was > 2 per 100 P-Y and the relative risk (vs. ESAs) exceeded 1.3. The OT+7 ascertainment window was used; however, results were essentially the same when analyzed with the OT+28 and OT+All windows (data not shown). The listings at the bottom of the table show the adverse events that correspond to adverse drug reactions in the ESA labeling.

Roxadustat shows a strong thrombosis signal here, even when compared to epoetin alfa, a drug for which thrombosis is a labeled adverse drug reaction. With 91% of study subjects on hemodialysis, the rates of device/shunt thrombosis (vascular access thrombosis) are approximately 8.2 and 6.1 per 100 P-Y for roxadustat and epoetin alfa, for a risk difference of 2.1 per 100 P-Y and a relative risk of 1.3. Note that this comparison is based on a large number of adverse events: 271 vs. 228 in the roxadustat and epoetin alfa groups, respectively. Deep vein thrombosis is infrequent (29 vs. 19 events), but the relative risk is 1.7. Vomiting appears here and also appears as a risk in the NDD patient population.

Among the adverse events that correspond to adverse drug reactions in the ESA labeling, the signals for rash, malignancy, MI, peripheral edema, and hypertension are most prominent. In fact, all of the adverse events that correspond with the adverse drug reactions of ESAs show relative risks near or above unity (Stevens-Johnson syndrome and toxic epidermal necrolysis excepted; they are rare). Based on these data, the adverse drug reactions in the ESA labeling should convey to the labeling of roxadustat, if approved.

Table 25: All Adverse Events—Studies 002, 063, 064; OT+7 Ascertainment Window

	Events	s, N (%)	Events (pe	r 100 PY)	Risk Difference	Relative Risk

Study 613

Table 26 shows the adverse events in that occurred at a frequency > 5% in the roxadustat group with a relative risk (vs. ESAs) that exceeded 1.3, as well as other significant adverse events. The thrombotic adverse events are once again prominent, even against the background of ESAs. (Of note, there are only a few strokes and MIs, and these favor the roxadustat group over the ESA group.) Signals for nausea and congestive heart failure are also obvious, and have been observed in other trials. With respect to the adverse events that correspond to adverse drug reactions in the ESA labels, the only adverse event with a significant number of events is systemic hypertension, which slightly favors roxadustat vs. ESAs.

Laboratory Findings

Laboratory findings were analyzed separately for the NDD and DD patient populations. The only important finding was related to abnormal hepatic laboratory values. We obtained expert consultation from the Division of Hepatology and Nutrition, who conferred with the Office of Surveillance and Epidemiology.

NDD population

Figure 5 is a standard eDISH scatterplot of total bilirubin (x upper limit of normal [ULN]) by peak alanine aminotransferase (ALT) or aspartate aminotransferase (AST) (x ULN) for the three principal studies in the NDD population. There were nine cases of increased total and direct bilirubinemia in the roxadustat treatment arms, vs. none in placebo (left upper cholestasis quadrant, yellow highlighted area). Few appeared in the right upper quadrant of the cholestatic scatterplot (data not shown), indicating that most of these jaundiced, cholestatic cases did not have significant elevations in alkaline phosphatase (AP). There was also a modest overall shift in patients in the roxadustat arm toward the upper right part of the eDISH plot (higher ALT/AST, higher bilirubin).

Figure 5: NDD population—Plot of Hepatocellular Injury (Total Bilirubin vs. ALT or AST)

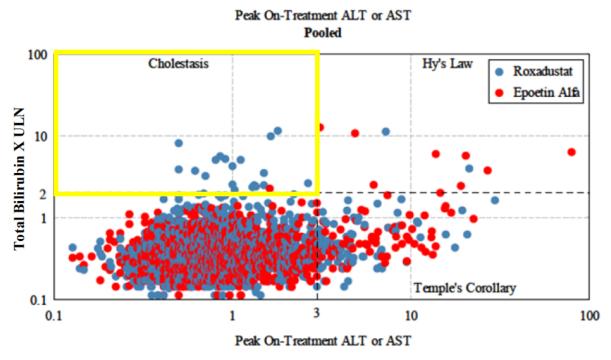

DD population

The eDISH scatterplot (Figure 6) does not show the same general shift in roxadustat-treated patients toward the upper right quadrant as was observed in the NDD trials. With equal randomization to roxadustat or epoetin alfa, there tend to be fewer roxadustat-treated patients in the Hy's Law and Temple's Corollary quadrants.

As was observed in the NDD studies, however, in the left upper cholestasis quadrant (yellow highlighted area) there are 19 roxadustat-treated subjects vs. 1 in epoetin alfa-treated subject. Few subjects

appeared in the right upper quadrant of the cholestatic scatterplot (data not shown). These findings also suggest direct hyperbilirubinemia, not accompanied by significant AP elevations.

Figure 6: DD population—Plot of Hepatocellular Injury (Total Bilirubin vs. ALT or AST)

For both the NDD and DD patient populations, our experts reviewed narratives and clinical details on all patients with important abnormalities in liver tests, and found a total of 19 patients of potential concern for severe DILI with jaundice, either cholestatic, hepatocellular, or mixed pattern. They assessed all cases as unlikely to represent liver injury due to roxadustat. All had a more likely competing diagnosis (e.g., sepsis, gallstone disease, shock liver, congestive hepatopathy, acute viral hepatitis), latency inconsistent with DILI, or resolution despite continuation of drug and/or negative re-challenge.

In summary, roxadustat may cause bland cholestasis (elevated bilirubin without significant elevation in hepatic transaminases), but no significant hepatocellular injury. For the overall NDD and DD populations, there were 19 cases in 4326 roxadustat-treated subjects, i.e., a rate of 0.44%. There were no Hy's Law cases; indeed, careful analysis of all suspicious cases revealed no cases of obvious DILI.

Bland cholestasis generally carries a good prognosis if the inciting event is resolved or the drug is held. Examples of drugs that cause DILI-related bland cholestasis include estrogens and androgens. The recommendation from our consultants was that bland cholestasis would not merit a Warning in labeling; however, for elevations of bilirubin/AP, the drug should be held until resolution, absent clear evidence of another cause, e.g., sepsis.

Analysis of MACE

NDD Patient Population

The objective of the NDD MACE assessment was to demonstrate non-inferiority of roxadustat compared with placebo with respect to cardiovascular risk, based on a meta-analysis of the three principal phase 3

randomized, placebo-controlled trials (001, 060, 608). As noted above, MACE was a composite endpoint that included MI, stroke, and all-cause mortality. Study endpoints were adjudicated by an independent clinical endpoint committee, whose members were blinded to treatment assignment.

The FDA did not agree prospectively on a risk margin and did not agree on the interpretation of the results using strictly a non-inferiority hypothesis testing approach. As such, our interpretation focuses on the estimation of the MACE risk and the uncertainty around it (95% confidence interval) in the NDD patient population.

The MACE meta-analysis included pre-specified, trial-specific stratification factors. The applicant also provided results using common stratification factors defined post hoc. The findings were qualitatively similar, regardless of the stratification factors.

Event Ascertainment Window: The ascertainment window for the primary analysis included the entire study duration, regardless of treatment exposure after randomization, referred to as the On-study analysis. An analysis using the OT+7 ascertainment window was conducted as a sensitivity analysis.

Analysis Model: For each trial, Cox regression was used to model the treatment effect (roxadustat vs. placebo), stratified by baseline Hb values ($< 8 \, \text{g/dL} \, \text{vs.} \ge 8 \, \text{g/dL}$); history of cardiovascular, cerebrovascular, or thromboembolic diseases (yes vs. no); baseline eGFR ($< 30 \, \text{vs.} \ge 30$); and geographic region (US vs. others for Studies 001 and 608; Western Europe vs. others for Study 608). Hazard ratios from each trial were combined using weights inversely proportional to the variance of the study-specific log HR estimates, thereby providing an overall estimate of the HR and its uncertainty (95% CI). This approach preserves the randomization of each trial and avoids a naïve assumption that the patient samples in each trial are exchangeable.

MACE Composite Endpoint—NDD Population: Results for time to first MACE for both the on-study and OT+7 analyses are shown in Table 27.

Table 27: Summary of MACE Anal	ysis Results in the NDD Population
--------------------------------	------------------------------------

	On-study Analysis (Primary)			OT+7 Analysis (Sensitivity)				
	Roxadustat Placebo			Roxadustat	Placebo			
	N = 2386 N = 1884 PY = 4509.6 PY = 3406.2			N = 2386	N = 1884			
				PY = 3843.2	PY = 2331.6			
Events (rate)	480 (10.6)	350 (10.3)		277 (7.2)	131 (5.6)			
HR (95% CI)	1.10 (0.96, 1.27)			1.38 (1.11, 1.70)				

There is a considerable difference between the estimated HRs for the primary On-study analysis and the OT+7 sensitivity analyses, with HRs (95% CI) of 1.10 (0.96, 1.27) and 1.38 (1.11, 1.70), respectively. Whereas the results seem reassuring for the On-study analysis, the lower limit of the 95% CI for the OT+7 sensitivity analysis (1.11) excludes 1.0. Although the exclusion of 1 in the OT+7 analysis merits concern, the differential exposure between roxadustat and placebo complicates the interpretation of the OT+7 analysis in isolation, as this may not represent a fair randomized comparison. For example, subjects who discontinue treatment early (higher in placebo than roxadustat) are censored at the point of treatment discontinuation. In a population in which MACE occurs at a rate > 5 per 100 PY, because subjects in the roxadustat arm are exposed to treatment for a longer duration, they are at risk for a

longer period of time. Thus, the differential dropout may contribute to a biased estimate of the treatment effect in the OT+7 analysis that disfavors roxadustat.

Figure 7 shows the Kaplan-Meier survival curves for MACE. Of note, the OT+7 analysis includes ~22% less follow-up time than the On-study analysis. Event rates (roxadustat vs. placebo) were 10.6 and 10.3 per 100 P-Y in the On-Study analysis, and 7.2 and 5.6 per 100 P-Y in the OT+7 analysis. Many events occurred beyond the 7-day post-treatment window of the OT+7 analysis, with disproportionately more events in the placebo group, especially for all-cause death.

Figure 7: Time to First MACE— On-study Analysis (Left); OT+7 Analysis (Right)

Source: FDA analysis.

MACE results are shown graphically by study, as well as by its components, for the On-study analysis (Figure 8) and the OT+7 analysis (Figure 9). For the On-study analysis where the overall estimated HR for MACE is 1.10, there are trends for increased stroke, and particularly increased MI, in the roxadustat treatment groups (Figure 8). For the OT+7 analysis where the overall estimated HR for MACE is 1.38, there is a nominally statistically significant finding for all-cause mortality (not favoring roxadustat), which is driven by the Study 001, the largest study (Figure 9). There are also trends for higher rates of stroke and MI for roxadustat, and these trends are fairly consistent across the three studies.

² Note that for this composite endpoint, the sums of the individual component events do not equal the total numbers of first MACE.

MACE in Study 610

Study 610 compared roxadustat to darbepoetin alfa, rather than a placebo. Results for time to first MACE are shown in Table 28 for the On-study and OT+7 approaches. For both analyses, the estimated HRs tended to favor roxadustat over darbepoetin alfa; however, the results were not statistically significant.

PY = patient years; OT+7 = On-treatment + 7 days analysis

DD Patient Population:

The objective of the MACE assessment in the DD population was to demonstrate non-inferiority of roxadustat to ESA, based on a meta-analysis of the three principal, phase 3, randomized, ESA-controlled trials (002, 063, 064). MACE was defined as it was for the NDD Population: the composite of all-cause mortality, MI, and stroke, and study endpoints were adjudicated by a blinded, independent clinical endpoint committee. The FDA did not agree prospectively on a risk margin using strictly a non-inferiority hypothesis testing approach. As such, our interpretation focuses on the estimation of the MACE risk and the uncertainty around it (95% CI) in the DD patient population. The primary analysis of MACE was based on the meta-analysis using pre-specified, trial-specific stratification factors.

Event Ascertainment Window: Two ascertainment windows were pre-specified in the protocol. The window of event ascertainment for the primary analysis was to include MACE that occurred after the first dose date and within 7 days after the last dose of study drug, or until the first dose of another anemia drug other than the randomized treatment. This is referred to as the OT+7 analysis.

As a sensitivity analysis, an On-study analysis was conducted that included events occurring during the study regardless of the treatment exposure after randomization.

Analysis Model: For each trial, Cox regression was used to model the treatment effect (roxadustat vs. ESA), stratified by geographic region (US vs. non-US); history of cardiovascular, cerebrovascular, or thromboembolic diseases (yes vs. no); screening Hb values (\leq 8 g/dL vs. > 8 g/dL for Study 063; \leq 10.5 g/dL vs. > 10.5 g/dL for Studies 064 and 002); average prescribed weekly ESA dose in the 4 weeks prior to randomization (epoetin alfa dose, or equivalent epoetin alfa dose for patients on non-epoetin alfa ESA at baseline, of \leq 150 vs. > 150 IU/kg/week for Study 064; not included as a stratification variable for Studies 063 and 002); and incident vs. stable dialysis (dialysis duration \leq 4 months vs. > 4 months for Study 002; not included as stratification variable for Studies 063 and 064). HRs were estimated for each study and then combined using weights inversely proportional to the variance of the study-specific log HR estimates to provide an overall estimate of the HR and its uncertainty (95% CI).

On-treatment Analysis Result (Primary Analysis): Comparing roxadustat to epoetin alfa, the estimated HR (95% CI) for time to first MACE event was 1.02 (0.88, 1.20), i.e., neutral (Table 29). There were 306

and 339 subjects with MACE in the roxadustat and ESA groups, respectively, with follow-up time-adjusted incidence rates of 9.4 and 9.3 per 100 P-Y.

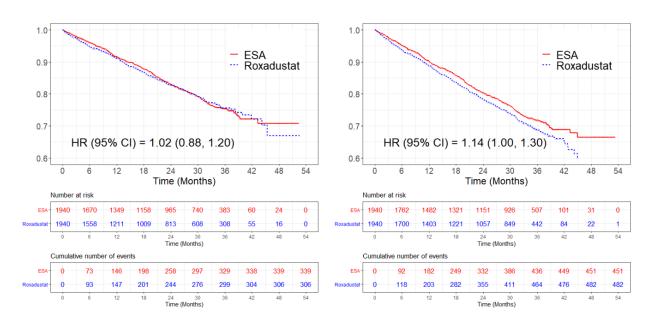

On-study Analysis Result (Sensitivity Analysis): The estimated HR (95% CI) for time to first MACE event was 1.14 (1.00, 1.30), such that the difference was nearly statistically significant (Table 29). There were 482 and 451 subjects with MACE in the roxadustat and ESA groups, respectively, with follow-up time-adjusted incidence rates of 12.4 and 10.9 per 100 P-Y. The HR was driven by differences in all-cause mortality and MI; stroke was neutral.

Adjudicated Death: During the OT+7 period in the combined DD studies, there were 207 and 232 deaths in roxadustat and epoetin alfa treated subjects, respectively, with exposure-adjusted rates of 6.2 and 6.1 per 100 P-Y. The estimated HR was 1.02 (0.84, 1.23) (Figure 11).

In the On-Study analysis, the HR was 1.17, with a 95% CI that excluded 1 (1.02, 1.35) (Figure 12). There were 413 and 369 deaths in roxadustat and epoetin alfa treated subjects, respectively, with exposureadjusted rates of 9.9 and 8.4 per 100 P-Y. The estimated HRs for all-cause mortality were fairly consistent across the 4 studies, and ranging from 1.09 to 1.43.

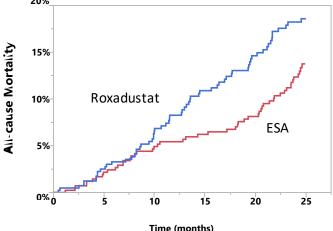

Study 613

Study 613 was not part of the pooled analysis because of differences in study design, however, there were 57 deaths (8.9 per 100 PY) in roxadustat-treated patients (N = 414) vs. 45 (6.3 per 100 PY) in the ESA group (N = 420) in the OT+7 ascertainment window. The nominal HR was 1.54, and the 95% CI (1.04, 2.28) excluded 1. There were additional deaths in the OT+28 and On-study analyses; however, the estimated HRs were similar and the 95% CIs also excluded 1.

Figure 13 shows the Kaplan-Meier graph for all-cause mortality for Study 613, OT+28 ascertainment window.

Figure 13: All-cause Mortality—Study 613; OT+28 Ascertainment Window

Relation Between Thrombotic Events, Roxadustat Dose, Hb Level, and **Hb Rate of Change**

The relation between the risk of adverse cardiovascular events, ESA dose, Hb concentration, and Hb rate of change has been of longstanding interest to FDA. The issues were initially raised in FDA's 2001 review of the Biologics License Application for darbepoetin alfa [10]. Given the similar nature of the safety signals for darbepoetin alfa and roxadustat and questions about roxadustat dose and excursions in Hb, we performed similar analyses for thromboembolic adverse events for the key studies in the roxadustat application, and asked the applicant to conduct the analyses to corroborate our findings.

Analyses were conducted for the OT+7 ascertainment window, separately for the NDD and DD populations. Only the first thromboembolic event was considered for patients who experienced more than one event.

Thromboembolic Events in Relation to Drug Dose

- A. The mean study drug dose (adjusted for weight) was calculated for each subject, and subjects were arranged in quintiles on this basis (by treatment group). The numbers of thromboembolic events were tabulated by dose quintile for both treatment groups and expressed as percent of subjects with events.
- B. Because these drugs are titrated to effect throughout the treatment period, an alternative analysis was conducted using a moving average of the dose. Specifically, for each week on treatment, the mean weight-adjusted dose was calculated for the preceding 4 weeks. For example, the dose at Week 16 was the mean dose during Weeks 12 through 16. Based on the mean weight-adjusted dose for each week, the patient-weeks were divided into quintiles, and the numbers of thromboembolic events were tabulated by quintile for both treatment groups. Event rates were expressed as events per 52 patient-weeks (P-Y). A similar analysis was conducted on the basis of the weight-adjusted dose during 2-week intervals preceding the events. Finally, the analysis was conducted on the basis of the weight-adjusted dose most proximal to the event (previous week).

NDD Patient Population

The relation between overall weight-adjusted study agent dose and thromboembolic events is shown in Figure 14 for the NDD subject population. The figure shows the 5 quintiles from lowest (Q1) to highest (Q5) dose. The y-axis shows the percent of subjects with events, and the numbers in each bar represent the numbers of subjects with events. There appear to be fewer events in Q1, the quintile with the lowest overall weight-adjusted dose.

Figure 14: Thromboembolic Events vs. Overall Total Weight-adjusted Dose of Study Agent—NDD Population

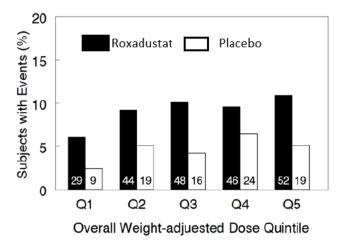

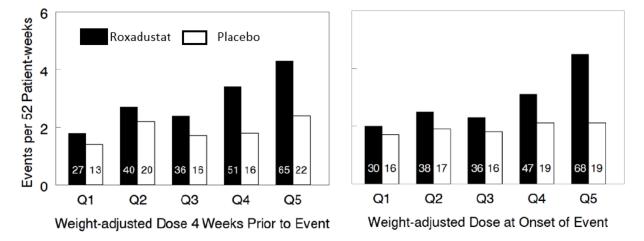

Figure 15 shows the relation between the rate of thromboembolic events (per 52 patient-weeks) and the weight-adjusted doses administered in the 4 weeks preceding the event (left) and the week preceding the event (right). The numbers inside the bars represent the numbers of events. Here, there are fairly strong associations between the preceding dose and thromboembolic events in roxadustat-

treated subjects. As expected, no association is evident in subjects who received placebo. The results for the 2 analyses are similar.

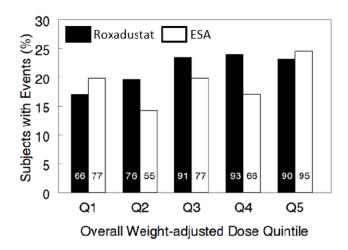

Figure 15: Thromboembolic Events vs. Weight-adjusted Dose of Study Agent—Received in Preceding 4 Weeks (Left); Received at Onset of Event (Right)—NDD Population

DD Patient Population

Figure 16 shows relations between weight-adjusted study agent dose and thromboembolic events. There appears to be a weak association between total dose and probability of a thromboembolic event in roxadustat-treated subjects. For subjects who received ESAs, there is no clear association.

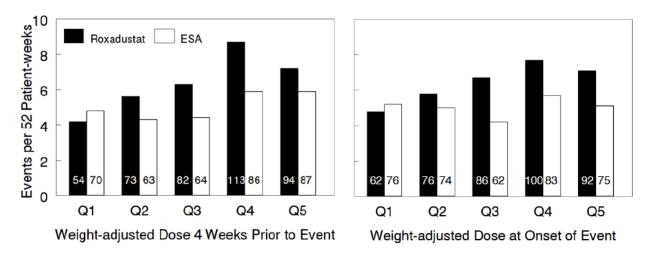

Figure 16: Thromboembolic Events vs. Overall Total Weight-adjusted Dose of Study Agent—DD Population

For subjects who received ESAs, the association is not clear. The results for the two analyses are similar.

Figure 17 shows a reasonable association between weight-adjusted dose and the rate of thromboembolic events in subjects who received roxadustat. For subjects who received ESAs, the association is not clear. The results for the two analyses are similar.

Figure 17: Thromboembolic Events vs. Weight-adjusted Dose of Study Agent—Received in Preceding 4 weeks (Left); Received at Onset of Event (Right)—DD Population

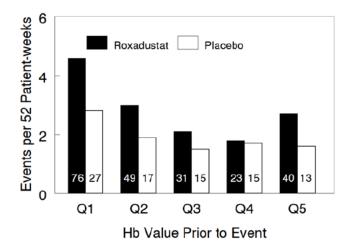

Thromboembolic Events in Relation to Hb Concentration

Hb values were estimated for all subjects for all weeks on-treatment, and the patient-weeks were placed into quintiles on this basis, separately by treatment arm. The numbers of thromboembolic events were assessed for each quintile for both treatment arms and expressed as rate per 52 patient-weeks.

NDD Patient Population

Figure 18 shows the relation between the rate of thromboembolic events and Hb concentration. It has been observed in a number of Hb target studies that subjects with lower Hb values are at higher risk of cardiovascular events. Thus, the relation seen in the figure is not surprising, although the increase in events in the highest quintile (Q5) in roxadustat-treated subjects suggests that targeting higher Hb values may lead to excess thromboembolic events.

Figure 18: Thromboembolic Events vs. Hb at the Time of Event—NDD Population

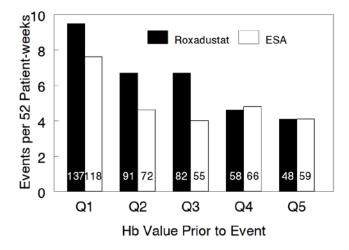

DD Patient Population

Figure 19 shows the relation between the rate of thromboembolic events and Hb concentration in the DD population, and once again there are greater numbers of cardiovascular events with lower Hb

values. The greater event rate in Q5 in the roxadustat subjects is not observed here as is was in the NDD population.

Figure 19: Thromboembolic Events vs. Hb at the Time of Event—DD Population

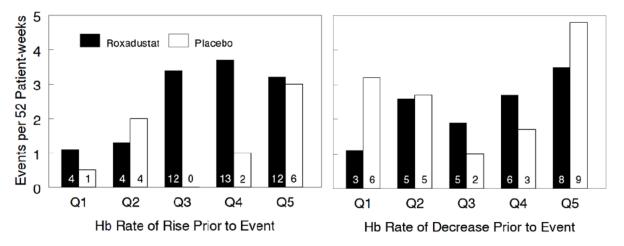

Thromboembolic Events in Relation to Hb Rate of Change

The Hb rate of change (g/dL/week) was estimated for each week that each subject was on treatment by fitting a linear regression line through the Hb values obtained during the preceding 4 weeks. Patientweeks with a rising Hb level (Hb vs. time slope was ≥ 0) were placed in quintiles. The adverse events were tabulated for each quintile for both treatment arms, and results were expressed as adverse events per 52 patient-weeks (P-Y). A similar analysis was conducted for Hb rate of decline, based on patientweeks with a falling Hb level (Hb vs. time slope < 0). Of note, rates of rise and decline could be estimated for only a limited number of events because Hb assessments were scheduled less frequently later in the trials, and two values were necessary to calculate a slope. The majority of the thromboembolic events occurred when only one Hb assessment was available and rate of change could not be estimated.

NDD Patient Population

Figure 20 shows the relation between thromboembolic events an Hb rate of rise leading up to the event. The numbers of events are quite small; most events did not have two Hb values leading up to the event that were necessary to calculate a slope. Nevertheless, there appears to be an association suggesting that limiting Hb rate of rise could decrease the incidence of thromboembolic events.

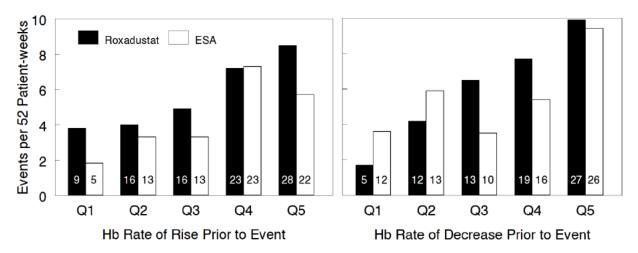

Figure 20: Thromboembolic Events vs. Hb Rate of Change Leading to Event—NDD Population

DD Patient Population

For the DD population, there were greater numbers of thromboembolic events for which a Hb slope could be calculated (Figure 21). There is a notable association between thromboembolic events and slope for both treatment groups, suggesting that measures to limit Hb rate of rise could decrease the frequency of thromboembolic events.

Figure 21: Thromboembolic Events vs. Hb Rate of Change Leading to Event—DD Population

Summary of Important Risks

Death

The results for all-cause mortality are difficult to interpret. In both the NDD and DD patient populations, the results of the meta-analyses are nearly neutral for the primary analyses, but nominally statistically significantly unfavorable for roxadustat in the sensitivity analyses. Specifically, for the NDD patient population, the estimated HR for the primary on-study analysis is 1.08, whereas there is a nominally statistically significant finding (not favoring roxadustat) for the OT+7 sensitivity analysis (HR = 1.40; 95% CI 1.08, 1.82). For the DD population, the estimated HR for the primary OT+7 analysis was 1.02, whereas the HR for the on-study sensitivity analysis was nominally statistically significant (HR 1.17, 95% CI 1.02,

1.35). Although Study 613 was not one of the studies in the meta-analysis, its mortality finding is a concern. In general, concordance between primary statistical analyses and sensitivity analyses provides confidence in the validity of the results. With the observed discordance here, the results are inconclusive.

Other important risks of MI, stroke, thrombosis, device/shunt thrombosis, systemic hypertension, seizure, and malignancy are summarized separately for the NDD and DD populations.

NDD Population

Table 30 summarizes the more important risks in the NDD patient population, as extracted from the principal data sources in the NDA. Note that the sample sizes and methods of expression differ among the sources. For studies 001, 060, and 068, the numbers in parentheses in the "Roxadustat" and "Comparator" columns represent rates per 100 P-Y. For study 610, the numbers in parentheses represent percent of subjects. Risk differences and relative risk are based on events per 100 P-Y for Studies 001, 060, 068, and percent of subjects for Study 610. For relative risk, the vertical dashed line is set to 1.0.

Study 610; Serious AEs	9 (3%)	7 (2%)	0.40	1.2

Relative to placebo, there are signals for all of the thrombotic adverse events, particularly the thrombosis query (RR \cong 1.6) and device/shunt thrombosis (RR \cong 3). Seizures have a RR \cong 6. Malignancy is neutral. Myocardial infarction, stroke, and hypertension have RRs in the 1.2- to 1.3-range, which are difficult to interpret given the differential rates of dropout between subjects who received roxadustat and placebo.

Adverse Events by Subgroup

Table 31 shows adverse events in the OT+7 ascertainment window for four major risks by subgroup. The numbers in the table represent events per 100 P-Y. Relative risks (RR) are unitless. Continuous variables are shown in quartiles, e.g., age, body mass index (BMI), baseline Hb, and baseline GFR.

Table 31: Major Risks by Subgroup in the NDD Population (All Adverse Events; OT+7 Analysis)

diabetes	Yes	57%	5.1	3.4	1.5	1.5	0.4	4.0	3.2	1.3	2.4	0.7	0.0	-	

Rox = roxadustat; Pbo = placebo; RR = relative risk; BMI = body mass index; eGFR = estimated glomerular filtration rate

For thrombosis (yellow column), the RRs are fairly consistent across subgroups; however, there are subgroups where risk trends higher. For example, a higher risk of thrombosis is evident in subjects with higher BMI, lower baseline Hb, and lower eGFR. The risk of sepsis (blue column) tends to be higher in

older subjects, as well as subjects with lower baseline Hb, lower baseline eGFR, and a history of CV disease or diabetes. Seizure risk (purple column) is higher in younger subjects. It is important to recognize that these are relatively small numbers of events; therefore, these estimates are subject to considerable uncertainty.

DD Population

Table 32 shows the important risks in the DD patient population. Note that the sample sizes and methods of expression differ among the sources. For studies 002, 063, and 064, the numbers in parentheses in the "Roxadustat" and "ESA" columns represent rates per 100 P-Y. For study 613, the numbers in parentheses represent percent of subjects. Risk differences and relative risk are based on events per 100 P-Y for Studies 002, 063, 064, and percent of subjects for Study 613. For relative risk, the vertical dashed line is set to 1.0. Note there are far more adverse events here than in the NDD subject population.

Table 32: Important Risks in the DD Patient Population

	Roxadustat	ESA	Risk Difference	Relative Risk

Relative to epoetin alfa, there are signals for MI (RR \cong 1.1), thrombosis (RR \cong 1.3), device/shunt thrombosis (\cong 1.5), and seizures (RR \cong 1.5). Stroke, hypertension, and malignancy are neutral (again, however, relative to epoetin alfa, for which these are labeled adverse drug reactions).

Adverse Events by Subgroup

Table 33 shows adverse events in the OT+7 ascertainment window for four major risks by subgroup. The numbers in the table represent events per 100 P-Y. Relative risks (RR) are unitless. Continuous variables are shown in quartiles, e.g., age, body mass index (BMI), baseline Hb, and baseline GFR

Table 33: Major Risks by Subgroup in the DD Population (All Adverse Events; OT+7 Analysis)

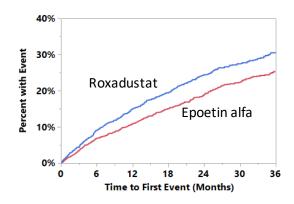

Events per Percent 100 P-Y of				Thrombosis, all		Device/shunt thrombosis, occlusion, malfunction, stenosis			Sepsis			Seizure

Rox = roxadustat; EPO = epoetin alfa; RR = relative risk; HD = hemodialysis; PD = peritoneal dialysis

For thrombosis (yellow column), the RRs are fairly consistent across subgroups; however, there are subgroups where risk trends higher. For example, a higher risk of thrombosis is evident in older subjects, subjects with higher BMI, subjects with a history of cardiovascular disease, subjects on hemodialysis, subjects with diabetes, and possibly females. The risk of device/shunt thrombosis (orange column) follows the same pattern. Note that for subjects on hemodialysis, the rates of device/shunt thrombosis, occlusion, malfunction, stenosis are 8.3 and 6.7 per 100 P-Y for roxadustat and epoetin alfa, respectively, for a risk difference of 1.6 events per 100 P-Y. The risk of sepsis (blue column) increases with age, BMI, a history of cardiovascular disease, diabetes, and hemodialysis (the latter for roxadustat only). Seizure risk (purple column) is higher in younger subjects and possibly subjects with low baseline Hb. It is important to recognize that these are relatively small numbers of events; therefore, these estimates are subject to considerable uncertainty.

Given the importance of thromboembolic events, we performed a Kaplan-Meier time-to-first thrombotic event analysis for the DD subject population (Figure 22) for all (left) and serious (right) events. The OT+7 ascertainment window was used for the analyses.

Figure 22: Time to First Thrombotic Event—All Events (Left); Serious Events (Right) for the DD Population (Studies 002, 063, and 064); OT+7 Ascertainment Window

Source: FDA analysis

The excess risk accrues continuously throughout the three studies.

1. EXECUTIVE SUMMARY

1.1. Introduction

FibroGen, in global partnership with AstraZeneca and Astellas, is seeking approval of roxadustat (FG 4592) for the treatment of anemia in patients with chronic kidney disease (CKD) not on dialysis and on dialysis. Treatment with roxadustat is intended for the correction of anemia by increasing and maintaining hemoglobin (Hb) in patients with CKD. Roxadustat is a first-in-class, potent, orally active, and reversible inhibitor of hypoxia-inducible factor prolyl hydroxylase (HIF-PH) enzymes. By transiently inhibiting HIF-PH enzymes, roxadustat stimulates a coordinated erythropoiesis in a manner consistent with the natural physiologic response to hypoxia. Roxadustat presents a valuable option for the treatment of anemia to reduce the need for transfusion where the current standard of care leaves unmet needs.

The clinical development program for roxadustat in patients with CKD anemia included 9 Phase 2 studies, 8 United States (US) and Global Phase 3 studies, and 8 additional Phase 3 studies in Japan and China (Figure 1). In agreement with the Food and Drug Administration (FDA), safety data from the 3 pivotal placebo-controlled studies in non-dialysis-dependent (NDD) patients (Studies 001, 060, 608) were pooled and data from the 3 pivotal active-controlled studies in dialysis-dependent (DD) patients (Studies 002, 063, and 064) were pooled in their respective indications as they shared key study design elements and were global studies. Two additional global Phase 3 studies—Study 610 and Study 613 had different trial designs compared to the pivotal Phase 3 studies and were not included in the respective study pools; however, results from these studies are included in this document. Unlike the other NDD studies, Study 610 was open-label and used an active comparator (darbepoetin alfa) instead of placebo, and the study was ongoing at the time of the New Drug Application (NDA) submission. In contrast to the other DD studies which used epoetin alfa (EPO) as a comparator, Study 613 used both EPO and darbepoetin alfa as active comparators. The additional Phase 3 Studies 302, 307, 308, 310, 312, and 314 were conducted only in Japan and Studies 806 and 808 were conducted only in China and were not included in the respective study pools. These studies were of shorter duration, may not have had comparator arms, and did not have safety events adjudicated. A brief summary of the safety data generated from the studies conducted in China and Japan is provided in Section 9.

FibroGen

Figure 1: Phase 2 and 3 Clinical Studies for the Development of Roxadustat for Patients with CKD Anemia

The data from more than 8,000 patients from the 6 pivotal studies demonstrated that roxadustat has a positive benefit-risk profile across the spectrum of CKD anemia in patients who are NDD and DD. The overall cardiovascular (CV) safety of roxadustat was shown to be comparable to placebo in patients with NDD CKD and to EPO in patients with DD CKD based on a comprehensive assessment of the roxadustat safety data via independent adjudication review. These findings support the use of roxadustat to safely increase Hb levels for patients with CKD anemia who need additional treatment options.

Roxadustat has been approved for DD and NDD CKD in China since 2018 and 2019, respectively, and in Japan since 2019 and 2020, respectively. Available post-marketing safety data have not shown any new unexpected risks.

1.2. Disease Background and Unmet Need

1.2.1. Overview of CKD Anemia

Anemia is common in patients with CKD – occurring in approximately 15% of patients with CKD in the US – and becomes increasingly severe as CKD progresses (Fishbane and Spinowitz 2018; Stauffer and Fan 2014). Anemia most commonly begins to develop when patients have between 20% and 50% of normal kidney function, and the majority of patients with a near total loss of kidney function, such as those with end-stage renal disease (ESRD), have anemia (Nakhoul and Simon 2016; St Peter et al 2018; USRDS 2020). Accordingly, approximately 50% of patients with Stage 4 to 5 CKD and more than 90% of patients with DD CKD are anemic (Nakhoul and Simon 2016).

Anemia is a condition marked by a deficiency in red blood cells (RBCs) (as measured by Hb levels) resulting in an inadequate oxygen-carrying capacity of blood to meet physiologic needs. The cause and extent of anemia may vary by age, sex, altitude, and smoking status (Stauffer and Fan 2014; WHO 2011). However, any disruption to erythropoiesis, such as that which occurs in CKD, has the potential to result in anemia.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

The Kidney Disease: Improving Global Outcomes (KDIGO) working group recommends that health care providers diagnose anemia in patients over 15 years old when Hb levels fall below 13 g/dL in males and 12 g/dL in females. Symptoms of anemia in patients with CKD often include low energy, fatigue, headache, impaired concentration, depression, impaired cognitive function, and overall reduced quality of life (QoL) (KDIGO Anemia Work Group 2012; Smith 2010). Additionally, anemia can reduce oxygen supply to the heart and cause increased heart rate and stroke volume, which may contribute to myocardial ischemia and lead to myocardial cell death. Anemia is associated with increased mortality and morbidity due to increased risk of CV hospitalization, all-cause- mortality (ACM), and progression of ESRD (Palaka et al 2020). Clinical changes due to acute anemia are generally reversible, but chronic anemia can lead to progressive and pathologic heart enlargement and left ventricular hypertrophy due to volume overload (Mozos 2015).

1.2.2. Pathophysiology of CKD Anemia

While anemia is defined by a decrease in Hb, its frequency and severity are complicated not only by the high degree of inflammation that patients with CKD experience but also by the effect of inflammation on currently available therapies. The etiology of anemia of CKD is complex and involves multiple pathological factors that impact erythropoiesis including: inflammation, which negatively affects multiple erythropoietic processes; elevated hepcidin, which restricts iron availability; and impaired oxygen sensing by the kidneys, which results in insufficient erythropoietin production by renal erythropoietin producing cells (specialized fibroblasts located between the renal tubules and capillaries in the cortex and outer medulla) (Shahbazi et al 2019). Inflammation contributes to the disrupted erythropoiesis that occurs in patients with CKD (Brugnara and Eckardt 2020; Icardi et al 2013; Nemeth and Ganz 2014; Shahbazi et al 2019). Increased inflammatory cytokines in CKD impairs production of erythropoietin and yields a reduced responsiveness or "hyporesponsiveness" to EPO-mediated differentiation and maturation of RBCs. As CKD progresses, erythropoietin production from REP cells is decreased to a level that is inadequate to maintain a normal rate of erythropoiesis (Fu et al 2016; Locatelli et al 2017; Souma et al 2016). As a result, Hb levels are reduced, causing anemia and systemic tissue hypoxia, and renal fibrosis may ensue (Shahbazi et al 2019). Additional factors that contribute to CKD anemia include chronic blood loss; iron, vitamin B12, or folic acid deficiency; and shortened RBC survival (from 120 days to 60–90 days) (Brugnara and Eckardt 2020).

1.2.2.1. Hepcidin and Iron Metabolism

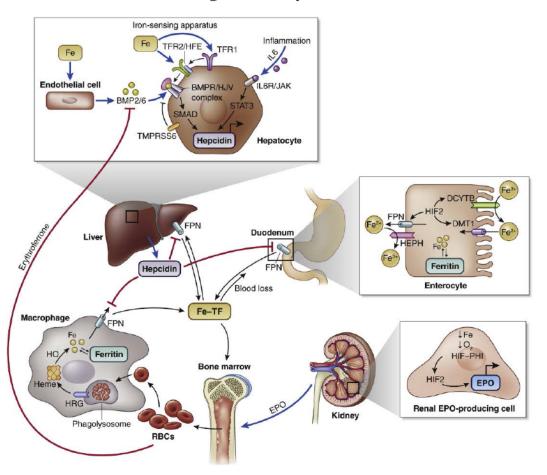

Several proteins, including ferritin and hepcidin, regulate iron levels in the body. Ferritin is an intracellular protein that stores iron and releases iron in a controlled fashion. Serum ferritin is elevated in patients with iron overload and decreased in patients with iron deficiency diseases (Jacobs et al 1972). Therefore, serum ferritin is used as an indirect marker of the total amount of iron stored in the body (Jacobs and Worwood 1975). However, factors such as inflammation, infection, and malignancy can elevate serum ferritin, which complicates the interpretation of serum ferritin levels (Wang et al 2010).

Hepcidin is a liver-derived key regulator of the entry of iron into the circulation (Ganz 2003). The role of hepcidin in regulation of systemic iron homeostasis is depicted in Figure 2. Hepcidin inhibits iron transport by binding to the iron export channel ferroportin, which is located on the surface of gut enterocytes, macrophages, and hepatocytes, leading to its internalization and degradation.

FibroGen

When the hepcidin level is abnormally high (eg, because of inflammation), serum iron decreases because of iron trapping within macrophages and liver cells and decreased gut iron absorption. This decrease in serum iron can lead to anemia because there is an inadequate amount of serum iron available for developing RBCs. Increased hepcidin activity contributes to reduced iron availability seen in anemia of chronic inflammation, such as kidney failure (Ashby et al 2009). Hepcidin levels are controlled by multiple stimuli including iron stores (Mazur et al 2003), hypoxia (Shah and Xie 2014; Silvestri et al 2008), inflammation (Nemeth et al 2003), and erythropoiesis including erythropoiesis stimulated by erythropoietin therapy in renal disease (Ashby et al 2009; Nicolas et al 2002; Pak et al 2006).

Source: Babitt et al 2021

High hepcidin levels result in iron sequestration in macrophages and hepatocytes (Zaritsky et al 2009) causing a clinical syndrome of functional iron deficiency. Clinically, this results in the need for high doses of IV iron to overcome the need for increasing doses of erythropoiesis-stimulating agents (ESAs) to achieve goal Hb levels (Goodnough et al 2010). The frequency by which patients receiving dialysis in the US experience this is represented by the fact that the mean ferritin levels (a marker of

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

intracellular iron stores whose upper limit of normal [ULN] is frequently 300 mg/dL) is approximately 800 mg/dL according to the DOPPS Clinical Practice Monitor (Karaboyas et al 2020).

Some patients with CKD have an absolute iron deficiency, which is characterized by severely reduced or absent iron stores in the bone marrow, liver, and spleen. Absolute iron deficiency can arise from an increased rate of blood loss during dialysis, gastrointestinal bleeding from the combination of gastritis and platelet dysfunction (Liang et al 2014), or decreased gastrointestinal iron absorption and malnutrition.

1.2.3. Treatment of CKD Anemia

The objective of treatment for patients with NDD and DD CKD anemia includes increasing and maintaining Hb levels, reducing the risk of RBC transfusions, and enhancing QoL. Treatment of anemia in NDD and DD CKD is widely supported by worldwide guideline groups and regulatory approvals. Nephrologists typically diagnose anemia in patients with CKD, and the treatment has evolved significantly over the past 3 decades. In 1988, approximately 75% of dialysis patients in the US had a hematocrit of < 30%, indicative of severe anemia. During this time, patients undergoing dialysis routinely had Hb levels in the 5–6 g/dL range with marked symptomatology (Eschbach et al 1989; Eschbach et al 1987). The cumulative burden of associated symptoms led to the frequent administration of RBC transfusions. In 1989, this paradigm changed with the introduction of EPO, a first-in-class ESA that was approved via an orphan drug designation for the indication, "to elevate the red blood cell level [...] and to decrease the need for transfusions [...]" (Procrit Package Insert 2008). Subsequent uptake of ESAs was rapid and facilitated by a coverage determination from Medicare, and RBC transfusion became rescue therapy. ESA treatment that results in supraphysiologic erythropoietin levels and iron therapy remain the cornerstone of anemia treatment in patients with advanced CKD; nevertheless, rescue therapy with RBC transfusion is common.

The results of several large studies raised concerns about the use of ESAs to treat anemia in patients with CKD and about target Hb concentrations. These studies include:

- Normal Hematocrit Trial (1998)
- Correction of Hemoglobin and Outcomes in Renal Insufficiency (CHOIR) in 2006
- Trial to Reduce Cardiovascular Events with Aranesp Therapy (TREAT) in 2009

The results of these studies suggested that targeting higher Hb levels with higher doses of ESAs may contribute to CV adverse events (AEs). In 2011, the FDA published a safety announcement and implemented label changes for ESAs that included new warnings and called for more conservative ESA dosing in patients with CKD (FDA 2011). The new labels warned that, in controlled trials in CKD, patients experienced greater risks for death, serious CV AEs, and stroke when treated with ESAs to target a Hb level of > 11 g/dL. In addition, the labels warned that no trial had identified a Hb target level, ESA dose, or dosing strategy that did not increase these risks. Therefore, the recommendation was that healthcare providers should consider starting ESA treatment when Hb < 10 g/dL for patients with CKD. Dosing should be individualized, and the lowest dose of ESA sufficient to reduce the need for RBC transfusions should be used, after which dosing should be adjusted as appropriate. This recommendation did not define how far below 10 g/dL would be appropriate for an individual to initiate ESA treatment or the Hb level to target with treatment. Further, the recommendation was to reduce the dose or discontinue therapy when Hb rose above 10 g/dL in patients with NDD CKD.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

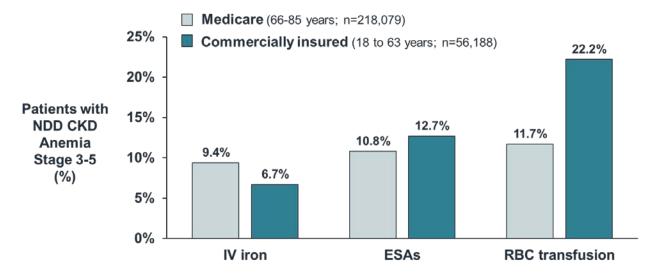

The KDIGO clinical practice guidelines for anemia in CKD were subsequently published in 2012, and these guidelines reflected the new FDA recommendations for ESAs. Each approved ESA product has a Boxed Warning for increased risk of death, myocardial infarction, stroke, venous thromboembolism, thrombosis of vascular access, and tumor progression or recurrence. Whereas these 2012 guidelines have attempted to mitigate the mortality and morbidity of anemia treatment in CKD, there has been limited subsequent innovation within the ESA category. New treatments have primarily been related to convenience through reducing the frequency of ESA injections, mainly in the NDD and home dialysis settings. There remains a significant unmet need for additional treatments for patients with CKD anemia, as reflected by a high rate of RBC transfusions in this patient population.

A further challenge in the treatment of CKD anemia is that many patients who are not on dialysis are not adequately treated for their anemia. Anemia treatment is initiated in a limited number of patients with NDD CKD, and treatment discontinuation is common in those who are treated due to the FDA labeled requirement to reduce or interrupt the ESA dose once a Hb level of 10 g/dL has been achieved (Davis et al 2020; St Peter et al 2018). In the US, fewer than 1 in 7 patients with NDD CKD were treated with an ESA in the 12 months prior to starting dialysis, and only 40% of patients with NDD CKD with Hb < 10 g/dL received any anemia medication within one year (St Peter et al 2018). Treatment with ESAs requires frequent clinic visits for many patients, from every week to monthly, depending on the prescribed ESA, as well as concurrent and not infrequent parenteral therapies. Particularly for patients who are not on dialysis, frequent travel to a healthcare facility is inconvenient or not even an option in underserved areas. A significant proportion of patients with NDD CKD are referred by their nephrologist to a hematologist due to the complexities and challenges of administering ESA and IV iron therapy, potentially impacting continuity of care. Accordingly, these patients are more likely than those without anemia to use healthcare resources, including hospitalizations and emergency department, hematologist, nephrologist, and outpatient (St Peter et al 2018).

The unmet need in patients with NDD CKD anemia is illustrated by the significant transfusion burden despite more than 30 years of ESA availability. Despite efforts including glycation and pegylation to increase ESA half-life and decrease dosing intensity, 40% of patients with NDD CKD require 1 or more RBC transfusions in the 2 years prior to the initiation of dialysis (Winkelmayer et al 2014). These findings support the concept that anemia is sub-optimally managed among patients with NDD CKD anemia in the real-world setting with a lack of sustained and efficacious treatment and a greater number of patients treated with RBC transfusions than ESAs on an annual basis in the US (St Peter et al 2018).

FibroGen

Figure 3: Most Common Treatments Used in Patients with NDD CKD Anemia

Abbreviations: CKD=chronic kidney disease; ESA=erythropoiesis-stimulating agent; IV=intravenous; NDD=non-dialysis-dependent; RBC=red blood cell.

Source: St Peter et al 2018

Whereas RBC transfusions carry risks of volume overload, transfusion reactions, transmission of blood-borne infection, and iron overload, they only provide for a transient amelioration of anemia. Most importantly and of specific concern for patients with CKD, RBC transfusions are also associated with a decreased likelihood of receiving a kidney transplant, longer wait time prior to transplantation, and a higher risk of kidney rejection following transplantation due to allosensitization, the activation of the adaptive immune system to foreign antigens resulting in the generation of antibodies (Hickey et al 2016). This issue is critically important for patients with CKD, because kidney transplantation is associated with substantial improvements in survival and QoL (Gill et al 2005; Kostro et al 2016; Oniscu et al 2005; Wolfe et al 1999). The risk of allosensitization has been shown to increase with increasing number of transfusions, and allosensitization is associated with increased rejection and graft loss, as well as longer wait times to transplantation (Orandi et al 2016). In ESRD, panel reactive antibody (PRA) is commonly accepted as a routine practice in transplant centers and represents an estimate of alloimmunization. The incidence of rejection is significantly higher in patients with sensitization (ie, $PRA \ge 10\%$) than in patients without sensitization. Accordingly, the probability of receiving a kidney transplant is inversely related to the PRA percentage; for every percent increase in the PRA above 20%, the risk of not receiving a kidney transplant increased by 5% (Bostock et al 2013; Domingues et al 2010).

Therefore, a therapy that reduces the complexities of anemia treatment and decreases the incidence of RBC transfusions, including in patients with NDD CKD who are not currently treated for their anemia with ESA therapy, would be an important advance.

1.2.4. Unmet Need

Patients with CKD would benefit from an oral treatment for anemia that is safe, effective, and convenient and improves treatment across their entire clinical course. An ideal treatment would be efficacious across the spectrum of patients with NDD and DD CKD anemia including those with high levels of inflammation and inadequate clinical response to standard of care. The unmet need for

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

additional treatments for CKD anemia is particularly apparent in patients who are incident to dialysis who are often hyporesponsive to ESA treatment due to inflammatory conditions, and patients undergoing home dialysis.

At the time of dialysis initiation in the US in 2018, patients had a mean Hb of 9.3 g/dL (USRDS 2018) due to limited use of ESAs, with less than 15% of patients treated for anemia of CKD contributing to the risk of transfusion that can affect their ultimate timing and success of transplantation. As would be expected in a population of patients who are generally untreated and who have low Hb at the time of dialysis initiation, rates of transfusion are highest in the 90 days following dialysis initiation, at nearly 150 transfusions/100 patient years (PY) (Wang et al 2016).

Inadequate response to ESAs is common and often due to inflammation and/or functional iron deficiency (Ganz 2003). Hyporesponsiveness is common in DD CKD, and patients who are hyporesponsive to ESAs require higher doses than non-hyporesponsive patients. Such high ESA doses have been associated with CV and thrombotic risk. ESA underperforms in those individuals with increased ferritin and hepcidin levels, indicative of clinical scenarios consistent with inflammation and functional iron insufficiency. These patients at present are devoid of clinical options beyond higher ESA doses, increased iron administration, or reliance on blood transfusion. Clinicians are regularly confronted with difficult treatment decisions in these patients who are inflamed or hyporesponsive, either opting for higher ESA doses with increased CV risk or lower ESA doses and increased requirement for RBC transfusion, which has its own risks and inconveniences. Relevantly, chronic ESA hyporesponders have approximately 7-fold higher monthly burden of RBC transfusion compared with patients who respond to ESA (Fishbane and Nissenson 2010; Kilpatrick et al 2008; Luo et al 2016; McCullough et al 2013).

The 2020 Advancing American Kidney Health Executive Order was a response to the challenges and barriers inherent in the care of individuals with CKD. The stated goal of this executive order is to "improve access to and quality of person-centered treatment options." Specifically, the executive order states, "We need to provide patients who have kidney failure with more options for treatment, from both today's technologies and future technologies such as artificial kidneys and make it easier for patients to receive care at home or in other flexible ways." The initiatives in this executive order include a number of measures meant to improve care and QoL for patients with CKD. Payment model adjustments were enacted to promote more widespread use of in-home dialysis, which is more convenient for patients than going into a dialysis center. More than 500,000 patients were on dialysis in 2016 and many of them spend 12 hours a week in dialysis centers (USRDS 2020).

In this context, the current standard of care with parenteral ESA therapy and regular administration of IV iron poses a burden for and a barrier to home hemodialysis and peritoneal dialysis. An oral therapy that can be self-administered in the home setting for hemodialysis and peritoneal dialysis patients will be a major advance in patient care, especially as more patients are treated in the home setting due to Centers for Medicare & Medicaid Services' objective to transition patients from in-center to home dialysis. Moreover, a therapy that reduces the requirement for IV iron in these home-treated patients will be an important clinical advance.

In summary, an ideal treatment for CKD anemia will be efficacious and IV iron mitigating or sparing and safe across the spectrum of NDD and DD CKD, including in patients with high levels of inflammation, inadequate iron mobilization, and inadequate clinical response to the current standard of care. An effective and convenient oral treatment can address the logistical challenges that many patients experience including IV access placement, need to travel to an infusion center, and increased

frequency of medical encounters; mitigate IV iron requirements and transfusion burden; and offer a more equitable access to therapy providing many patients on home dialysis and patients not on dialysis the opportunity to have appropriately managed anemia of CKD. Furthermore, a treatment with a novel mechanism of action that provides a "coordinated erythropoiesis," better reduces hepcidin, and improves iron bioavailability would empower personalized care aligned with patients' and healthcare providers' goals and more effectively treat CKD anemia.

1.3. Efficacy of Roxadustat in Patients with NDD CKD Anemia

1.3.1. Study Design

All 3 NDD studies (060, 608, and 001) were similarly designed, multicenter, randomized, double-blind, placebo-controlled trials (Table 1). Adult male and female patients with CKD Stage 3–5, estimated glomerular filtration rate (eGFR) < 60 mL/min/1.73 m², and Hb \leq 10.0 g/dL at baseline were enrolled globally. Patients were randomized 2:1 to roxadustat and placebo in Studies 608 and 060 and 1:1 in Study 001. Target Hb with roxadustat treatment was 10–12 g/dL, and treatment duration was up to 4 years. The primary efficacy endpoint for all 3 studies was the mean change in Hb from baseline to mean over Weeks

28 to 52 regardless of rescue therapy (ie, RBC transfusion, ESA use, and intravenous [IV] iron supplementation). Secondary efficacy endpoints included the proportion of Hb responders (ie, Hb level of ≥ 11 g/dL with an increase of 1 g/dL for patients with baseline Hb > 8 g/dL and an increase of 2 g/dL for patients with baseline Hb ≤ 8 g/dL) without rescue, use of rescue therapy (ie, RBC transfusion, ESA use, and IV iron supplementation), RBC transfusion, change in hepcidin and iron parameters, and health-related quality of life (HRQoL). Given the similar study designs, the efficacy results for these studies were pooled for the NDA and are presented as such in this briefing document.

Table 1: Overview of NDD Study Designs

	Pivotal Phase 3 NDD Studies				
	Study 001	Study 060	Study 608		
Region	Global	Global	Global		
Randomized, double-blind	Yes	Yes	Yes		
Control	Placebo	Placebo	Placebo		
Baseline Hb	< 10.0 g/dL	≤ 10.0 g/dL	≤ 10.0 g/dL		
Randomization scheme	1:1	2:1	2:1		
Duration (years)	1 – 4	1 – 4	1 – 2		

Abbreviations: Hb=hemoglobin; NDD=non-dialysis-dependent.

1.3.2. Patient Disposition and Demographics

A total of 4,270 eligible patients from the 3 pivotal Phase 3 studies were randomized to roxadustat (N=2,386) or placebo (N=1,884) and received at least 1 dose of study treatment. Overall, 82% of patients in the roxadustat group and 71% of patients in the placebo group completed study treatment to the period during which the primary efficacy endpoint could be assessed (Figure 4). Because the primary efficacy endpoint is change from baseline to Week 28–52, it is relevant to present information as to how many patients continued treatment to these timepoints.

Figure 4: Pooled NDD Studies: Patient Disposition

Abbreviation: NDD=non-dialysis-dependent.

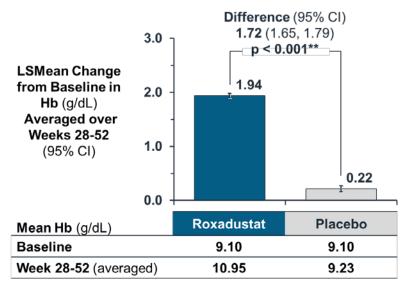

Baseline demographics and disease characteristics were similar between groups and were reflective of patients with NDD CKD globally. The mean age was approximately 62 years old, and baseline disease characteristics were similar between treatment groups. Baseline Hb was 9.10 g/dL, and a similar proportion of patients had Hb levels < 8.0 at baseline. Baseline eGFR was < 15 mL/min/1.73 m² in 42.5% of patients, and < 10 mL/min/1.73 m² in 19.6% of patients. Additional details are provided in Section 5.1.2.

1.3.3. Efficacy Results

The pre-specified primary efficacy endpoints were met in each individual study. Approval for efficacy is based on individual studies. To facilitate the presentation of efficacy, pooled results are presented rather than each of the individual studies where the results of individual studies were similar in terms of direction and magnitude. The reader should be reminded that while individual studies were controlled for multiplicity, this was not employed in the pooled analyses.

In the pooled analysis, the roxadustat group showed an improvement in mean Hb levels regardless of rescue therapy (ie, RBC transfusion, ESA use, and IV iron supplementation) compared to placebo (Figure 5).

Figure 5: Pooled NDD Studies: Mean Change in Hb from Baseline to Mean Over Weeks 28 to 52 Regardless of Rescue Therapy*

Abbreviations: CI=confidence interval; ESA=erythropoiesis-stimulating agent; Hb=hemoglobin; IV=intravenous(ly); LS=least square: NDD=non-dialysis-dependent; RBC=red blood cell.

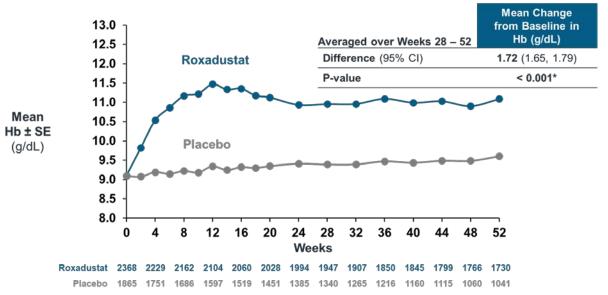

Note: Intent-to-treat analysis set.

Figure 6 compares the mean Hb over time, up to Week 52, between the pooled roxadustat and placebo groups in patients with NDD CKD. In the pooled roxadustat group, Hb increased starting from Week 2 through Week 12, following which the mean Hb level stabilized and was maintained close to 11.0 g/dL through the rest of the study period. By contrast, in the pooled placebo group, Hb levels remained relatively flat and close to baseline (approximately 9.0 g/dL) up to Week 52.

^{*}Rescue therapy included RBC transfusion, ESA use, and IV iron supplementation.

^{**}P-value not controlled for multiplicity.

Figure 6: Pooled NDD Studies: Mean (±SE) Hb (g/dL) over Time up to Week 52

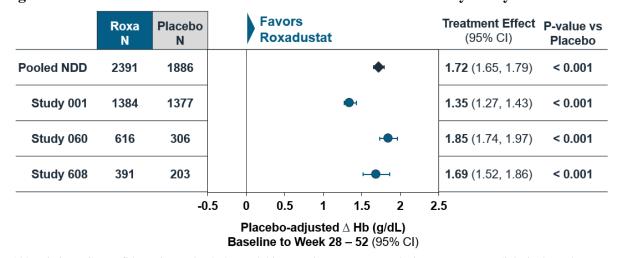

Abbreviations: CI=confidence interval; Hb=hemoglobin; NDD=non-dialysis-dependent; SE=standard error.

Note: Full analysis set.

*p-value not controlled for multiplicity.

Importantly, statistically and clinically significant improvements from baseline in mean Hb levels were seen across the 3 individual NDD studies. As shown by the placebo-adjusted treatment effect for roxadustat in Figure 7, the treatment effect for each of the pivotal studies in patients with NDD CKD was statistically significant compared to placebo.

Figure 7: Pooled NDD Studies: Roxadustat Treatment Effect by Study

Abbreviations: CI=confidence interval; Hb=hemoglobin; ITT=intent-to-treat analysis set; NDD=non-dialysis-dependent; OT+7=on-treatment plus 7 days; Roxa=roxadustat.

Note: Study 001 was analyzed using the ITT observational period; Studies 060 and 608 were analyzed using OT+7.

Additionally, the treatment effect consistently favored roxadustat across a wide range of pre-specified subgroups including region, sex, baseline high-sensitivity C-reactive protein (hsCRP), and eGFR range (Figure 8). Patients with the lowest eGFR at baseline had the lowest Hb levels at baseline, and therefore had a greater change from baseline than patients with higher eGFR at baseline.

Figure 8: Pooled NDD Studies: Roxadustat Treatment Effect by Subgroup

	Roxa N	Placebo N		Favors Roxadustat	Treatment Effect (95% CI)	P-value vs Placebo

Note: Intent-to-treat analysis set.

Patients treated with roxadustat demonstrated a consistent Hb response irrespective of iron repletion status at baseline (Figure 9). Patients who were not iron replete (ie, ferritin < 100 ng/mL or TSAT < 20%) at baseline had similar change from baseline in Hb levels as those who were iron replete while utilizing similar doses of roxadustat and without requiring more transfusions or IV iron.

Figure 9: Pooled NDD Studies: LSMean Change from Baseline in Hb Levels in Patients Who Were Iron Replete* vs Iron Non-replete at Baseline

Abbreviations: Hb=hemoglobin; LS=least square; NDD=non-dialysis-dependent; TSAT=transferrin saturation.

^{*}mL/min/1.73 m²

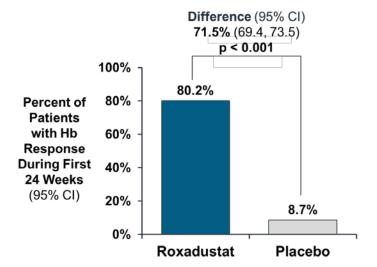

^{**}p-value not controlled for multiplicity.

^{*}Iron replete was defined as TSAT \geq 20% and ferritin \geq 100 ng/mL; mean change from baseline to mean of Weeks 28 to 52.

^{**}P-value not controlled for multiplicity.

As shown in Figure 10, a higher percentage of roxadustat-treated patients achieved Hb response (defined as Hb \geq 11.0 g/dL and increase by \geq 1.0 g/dL in patients with baseline Hb > 8.0 g/dL, or Hb increase by \geq 2.0 g/dL in patients with baseline Hb \leq 8.0 g/dL) during the first 24 weeks compared to placebo, with a treatment difference of 71.5% without rescue.

Figure 10: Pooled NDD Studies: Proportion of Patients with Hb Response

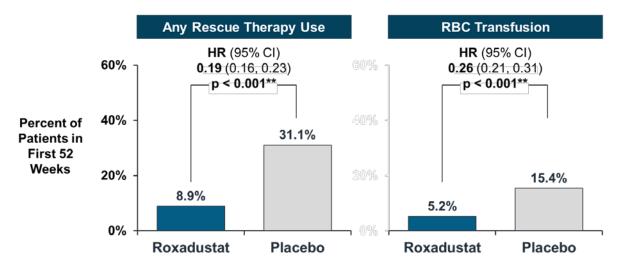

Baseline	Response Criteria
Hb > 8.0 g/dL	Hb ≥ 11.0 and Increase by ≥ 1.0
Hb ≤ 8.0 g/dL	Increase by ≥ 2.0

Abbreviations: CI=confidence interval; Hb=hemoglobin; NDD=non-dialysis-dependent. Note: Censored for rescue therapy.

Fewer patients from the roxadustat treatment group required any rescue therapy (ie, RBC transfusion, ESA use, or IV iron) or RBC transfusion compared to the placebo group during the first 52 weeks of treatment (Figure 11). A total of 124 patients (5.2%) in the roxadustat group required RBC transfusion compared to 288 (15.4%) in the placebo group, corresponding to an incidence rate of 6.1 patients with transfusion per 100 PY for roxadustat, and 20.4 per 100 PY for placebo.

^{*} P-value not controlled for multiplicity.

Figure 11: Pooled NDD Studies: Patients Receiving Any Rescue Therapy* or RBC Transfusion During the First 52 Weeks

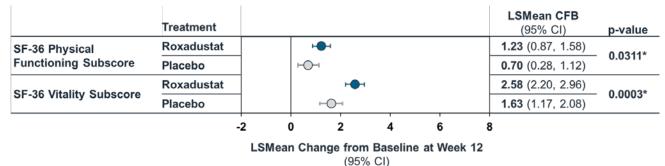

Abbreviations: CI=confidence interval; ESA=erythropoiesis-stimulating agent; HR=hazard ratio; IV=intravenous(ly); NDD=non-dialysis-dependent; RBC=red blood cell.

Note: Full analysis set.

HRQoL was assessed using patient-reported outcome measures. The physical functioning and vitality domains of the SF-36 v2 were included as secondary endpoints in the pooled analysis (Figure 12). Both roxadustat and placebo-treated patients reported least squares mean (LSMean) increases from baseline to Week 12 across all HRQoL endpoints. The difference between roxadustat and placebo-treated patients did not meet minimal clinically important difference (MCID) thresholds in any of the studies.

Figure 12: Pooled NDD Studies: LSMean Change from Baseline in Health-Related Quality of Life Scores at Week 12

Abbreviations: CI=confidence interval; CFB=change from baseline; LS=least square; NDD=non-dialysis-dependent; SF-36=36-item short form survey.

Note: Full analysis set.

1.3.4. Supportive Phase 3 NDD Study 610

In addition to the 3 pivotal NDD CKD placebo-controlled studies, Study 610 was a Phase 3 study to evaluate the roxadustat efficacy and safety in patients with NDD CKD with an active control,

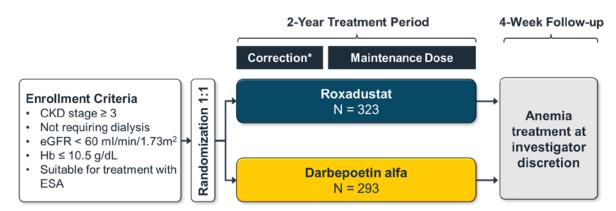

^{*}Rescue therapy included RBC transfusion, ESA use, and IV iron supplementation.

^{**}P-value not controlled for multiplicity.

^{*}p-value not controlled for multiplicity.

darbepoetin alfa (Figure 13). Study 610 was not pooled for analysis with the other NDD CKD studies because it used an active control and remains as a stand-alone study.

Figure 13: Study 610 Design

Abbreviations: CKD=chronic kidney disease; eGFR=estimated glomerular filtration rate; ESA=erythropoiesis-stimulating agent; Hb=hemoglobin.

A total of 930 patients were screened and 616 were randomized to receive treatment, 323 to the roxadustat treatment group and 293 to the darbepoetin treatment group. Those patients are included in the Intent-To-Treat (ITT) and Safety Populations for statistical analysis.

Baseline demographics were comparable between the roxadustat and darbepoetin treatment groups, with mean age (66.8 in roxadustat vs 65.7 in placebo), and mean body mass index (BMI) (27.95 vs 28.74). The majority of patients were White (95.3% overall) and were randomized in Central and Eastern Europe (70.1%). Median baseline Hb was 9.68 g/dL for the roxadustat treatment group and 9.70 g/dL in the darbepoetin treatment group. Median baseline eGFR (17.5 mL/min/1.73 m² vs 18.5 mL/min/1.73 m²) was comparable between groups and was < 30 mL/min/1.73 m² for 82.5% patients overall (81.7% roxadustat vs 83.3% darbepoetin).

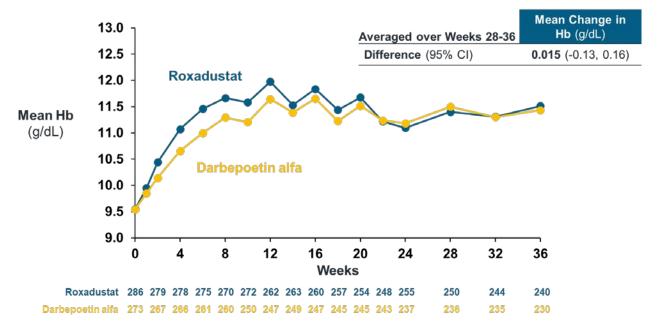

Treatment duration was considered comparable between treatment groups (median 103.71 weeks in the roxadustat treatment group vs 100.14 weeks in the darbepoetin treatment group). Total patient exposure years (PEY) on treatment was greater in the roxadustat treatment group (519.3 years) than the darbepoetin treatment group (472.5 years), because of the greater number of patients in the roxadustat treatment group.

<u>Primary Endpoint: Percentage of Hb Responders during the First 24 Weeks of Treatment Without Rescue Therapy</u>

In general, the efficacy data from Study 610 was consistent with other pooled pivotal studies. After 12 weeks, mean Hb levels stabilized and were comparable between treatment groups. In addition, mean Hb levels averaged over Weeks 28 to 36 demonstrated noninferiority of roxadustat to darbepoetin alfa (Figure 14).

^{*}Duration of correction phase is variable in length for each patient depending on when they reach $Hb \ge 11.0 \text{ g/dL}$ and an Hb increase from baseline $Hb \ge 1.0 \text{ g/dL}$

Figure 14: Study 610: Mean Change in Hb Levels Over Time

Abbreviations: CI=confidence interval; Hb=hemoglobin.

Note: Per protocol analysis set.

Hb Change from Baseline to Average Hb in Weeks 28 to 36 Without Rescue Therapy

The LSMean change was 1.85 (95% confidence interval [CI]: 1.75, 1.96) g/dL for patients in the roxadustat group and 1.84 g/dL (95% CI: 1.73, 1.94) for patients in the darbepoetin alfa group. The LSMean difference for roxadustat vs darbepoetin alfa was 0.015 g/dL (95% CI: -0.13, 0.16), signifying noninferiority of roxadustat to darbepoetin alfa based on a margin for noninferiority of > -0.75 g/dL.

Time to First IV Iron Use During First 36 Weeks

Significantly fewer patients in the roxadustat treatment group required IV iron use during the first 36 weeks. The incidence rate per 100 PY at risk was lower in the roxadustat group (9.9) compared with the darbepoetin alfa group (21.2), and the hazard ratio (HR) was 0.45 (95% CI: 0.26, 0.78; p=0.004).

Table 2: Study 610: IV Iron Use During the First 36 Weeks

	Roxadustat	Darbepoetin Alfa		
	N=322	N=292		
Patients with IV Iron	20 (6.2%)	37 (12.7%)		
Cumulative Time at Risk (PY)	201.8	174.5		
Incidence Rate (Per 100 PY)	9.9	21.2		
Hazard Ratio (95% CI), p-value	0.45 (0.26, 0.78), P=0.004			

Abbreviations: HR=hazard ratio; IV=intravenous(ly); PY=patient years.

1.4. Efficacy of Roxadustat in Patients with DD CKD Anemia

1.4.1. Study Design

The 3 pivotal DD studies (063, 064, and 002) were similarly designed, multicenter, randomized, open-label, clinical trials assessing the efficacy and safety of roxadustat compared with EPO (Table 3). Adult male and female patients with CKD on dialysis with threshold Hb < 10.0 g/dL at baseline (if not on ESA), and < 12.0 g/dL (if on ESA) were enrolled globally. Patients in these studies were randomized 1:1 to roxadustat and EPO. Target Hb was 10–12 g/dL with roxadustat treatment and as labeled for EPO, and the study durations were up to 4 years.

These studies included a pre-specified subpopulation of incident dialysis (ID) patients (ie, patients who started dialysis within \leq 4 months of study participation). The subpopulation of patients with ID-DD CKD consisted of all patients from Study 063 and a subset of eligible patients from Study 002 and Study 064 (14.1% and 9.6%, respectively).

The primary endpoint in all 3 studies was the same as that in the NDD studies: mean change from baseline in Hb to mean over Weeks 28 to 52, regardless of rescue therapy (ie, RBC transfusion and ESA). Secondary endpoints included Hb change by baseline inflammatory status (hsCRP > ULN) – because of the known underperformance of EPO in patients who are inflamed – as well as RBC transfusion, and IV iron use. Hepcidin and serum iron storage parameters were investigated as exploratory endpoints.

Table 3: Overview of DD Study Designs

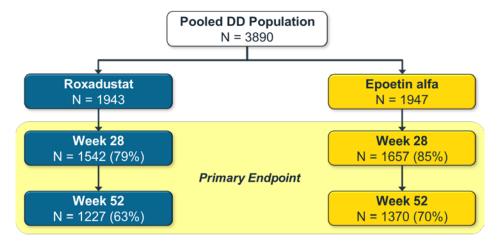

]	Pivotal Phase 3 DD Studies				
	Study 002	Study 063	Study 064			
Region	Global	Global	United States			
Design	Open-label	Open-label	Open-label			
Control	Epoetin alfa	Epoetin alfa	Epoetin alfa			
Randomization scheme	1:1	1:1	1:1			
Duration (years)	≤4 years	≤4 years	≤4 years			
Baseline Hb (g/dL)	< 12 if on ESA	< 10	9.0 – 12 (DD)			
	or < 10	≤ 10	8.5 – 12 (ID-DD)			

Abbreviations: DD=dialysis-dependent; ESA=erythropoiesis-stimulating agent; Hb=hemoglobin; ID-DD=incident dialysis-dependent.

1.4.2. Patient Disposition and Demographics

A total of 1943 patients were randomized in the roxadustat group and 1947 in the EPO group for a total of 3,890 patients who were included in the ITT set (Figure 15). A total of 1940 patients in each group received at least 1 dose of study drug and were included in the Safety Analysis Set. The ID-DD subpopulation consisted of 1,530 patients, and the stable dialysis-dependent (SDD) subpopulation consisted of 2,360 patients. Overall, 79.4% of patients in the roxadustat group and 85.1% of patients in the EPO group completed treatment to the period during which the primary endpoint was assessed.

Figure 15: Pooled DD Studies: Patient Disposition

Abbreviations: DD=dialysis-dependent.

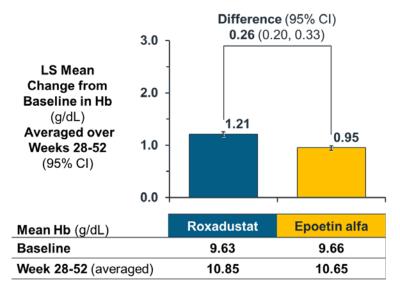

Baseline demographics were similar between the groups and are reflective of the underlying population of patients with DD CKD globally. The mean age of patients was approximately 55 years and ranged from 18 to 94 years. While globally, 61% of patients were White, approximately 18% were Black, and 14% were Asian, and among patients enrolled in the US, 40% were African American.

Approximately half of patients had diabetes. More than 90% utilized hemodialysis as their modality and 10% utilized peritoneal dialysis. Mean baseline Hb was approximately 9.6 g/dL, and a similar proportion of patients had Hb levels of < 10 at baseline in each group. Among patients with baseline hsCRP (n=3,246), the mean hsCRP at baseline was also similar between the groups, with a similar proportion of patients with hsCRP above ULN. Mean baseline iron parameters including hepcidin, transferrin saturation (TSAT) and ferritin were also comparable between groups. Additional details on baseline demographics are provided in Section 5.2.2.

1.4.3. Efficacy Results

The pre-specified primary efficacy endpoints were met in each individual study (Figure 17). To summarize these studies, pooled results are presented below. In the pooled analysis, the effect including the 95% CI of roxadustat was within the pre-specified non-inferiority margin (-0.75 g/dL), thereby demonstrating noninferiority compared to EPO on mean change from baseline in Hb over Weeks 28 to 52 regardless of rescue therapy (ie, RBC transfusion and ESA) (Figure 16).

Figure 16: Pooled DD Studies: Mean Change in Hb from Baseline to Mean Over Weeks 28 to 52 Regardless of Any Rescue Therapy*

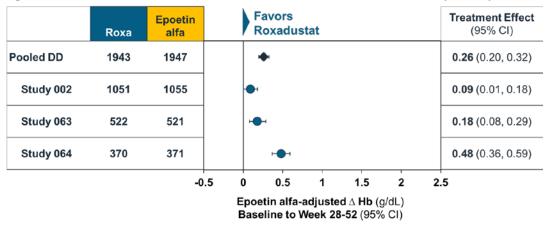

Abbreviations: CI=confidence interval; DD=dialysis-dependent; Hb=hemoglobin; LS=least square.

Note: Intent-to treat analysis set.

Importantly, the Hb response with roxadustat was consistent across the DD studies, with a non-inferior treatment effect of roxadustat compared to EPO in each individual study (Figure 17).

Figure 17: Pooled DD Studies: Roxadustat Treatment Effect by Study

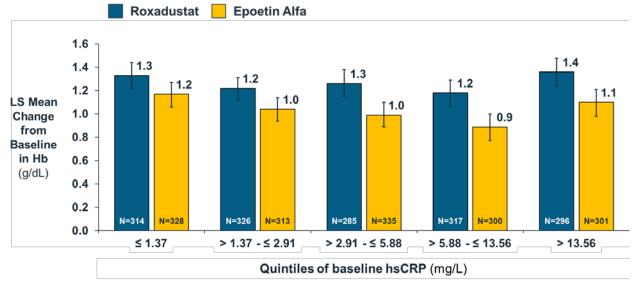

Abbreviations: CI=confidence interval; DD=dialysis-dependent; Hb=hemoglobin; Roxa=roxadustat. Note: Intent-to treat analysis set; non-inferiority margin=-0.75.

The ability of roxadustat to maintain Hb in the presence of inflammation likely related to its mechanism of action is an important clinical differentiator from ESA. While the treatment difference is clinically similar between roxadustat and EPO as quintiles of patients based on CRP are examined (Figure 18), roxadustat doses did not increase with increasing baseline hsCRP levels (Figure 19). In contrast, EPO dose requirements increased with increasing baseline hsCRP levels, reflecting the likely effect of inflammation on EPO dosing that is not affected in roxadustat dosing.

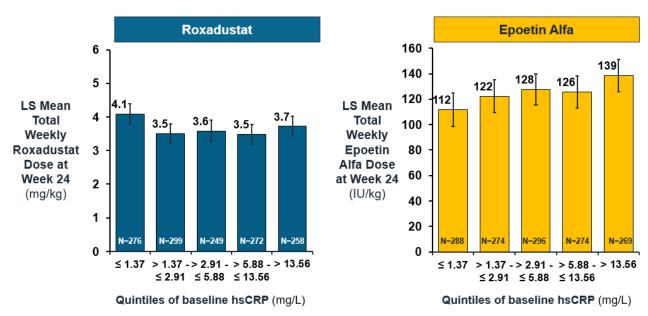

^{*}Rescue therapy consisted of red blood cell transfusion and erythropoiesis-stimulating agent.

Figure 18: Pooled DD Studies: Mean Hb Change from Baseline by hsCRP Quintiles at Baseline

Abbreviations: DD=dialysis-dependent; Hb=hemoglobin; hsCRP=high-sensitivity C-reactive protein; LS=least square. Note: Intent-to-treat analysis set.

Figure 19: Pooled DD Studies: Mean Weekly Study Drug Doses by Baseline hsCRP Quintiles

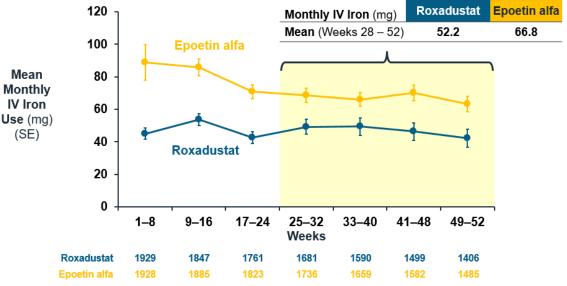

Abbreviations: DD=dialysis-dependent; hsCRP=high-sensitivity C-reactive protein; LS=least square. Note: Intent-to-treat analysis set

As shown in Figure 20, roxadustat-treated patients received less monthly IV iron than patients treated with EPO (p < 0.0001). In the Phase 3 studies, IV iron supplementation was permitted if the investigator thought that the patient had not responded adequately while taking oral iron or could not tolerate oral iron and was considered iron deficient as determined by either ferritin < 100 ng/ml or TSAT < 20%. On average, roxadustat-treated patients required 52 mg of IV iron over Weeks 28 to 52 compared to 67 mg iron required by EPO-treated patients. The difference in IV iron needs to be

interpreted in the context of patients in the roxadustat arm achieving numerically higher Hb levels with fewer transfusions. This is supportive of the Phase 2 Study 053 in which patients receiving roxadustat treated with oral iron were able to achieve and maintain similar Hb levels and similar iron stores as compared to those treated with IV iron (Besarab and Szczech 2014).

Figure 20: Pooled DD Studies: Average Monthly IV Iron Use Per Patient Exposure Month Over Weeks 28 to 52 (Full Analysis Set)

 $Abbreviations: DD = dialysis - dependent; \ IV = intravenous(ly); \ SE = standard \ error.$

Note: Full analysis set.

Numerically fewer patients treated with roxadustat required RBC transfusions compared with EPO, demonstrating non-inferiority between roxadustat and EPO (Figure 21).

Figure 21: Pooled DD Studies: Requirement for RBC Transfusion During Treatment

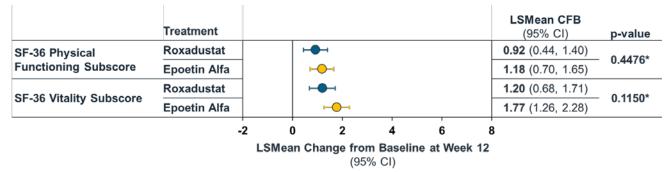

Abbreviations: CI=confidence interval; DD=dialysis-dependent; HR=hazard ratio; RBC=red blood cell. Note: Full analysis set.

The physical functioning and vitality domains of the 36-item short form questionnaire (SF-36) v2 were included as secondary endpoints in one of the studies and were exploratory endpoints in the other

study (Figure 22). Both roxadustat and EPO-treated patients reported LSMean increases from baseline to Week 12 across all HRQoL endpoints in the pooled analysis. There was no clinically meaningful difference between patients on roxadustat compared to EPO in the pooled analysis. This finding is expected as patients in both treatment arms experienced corrected Hb levels, leading to improved HRQoL compared with baseline. LSMean treatment differences between roxadustat and EPO-treated patients did not meet MCID thresholds.

Note: Full analysis set.

1.4.4. Important Subgroups Across the Continuum of Patients with CKD

As patients were followed for up to 4 years, some patients initiated dialysis during the studies. As shown in Figure 23, roxadustat maintained Hb levels while patients transitioned to dialysis through at least 6 months. The figure shows continued maintenance of Hb through the transition to dialysis initiation.

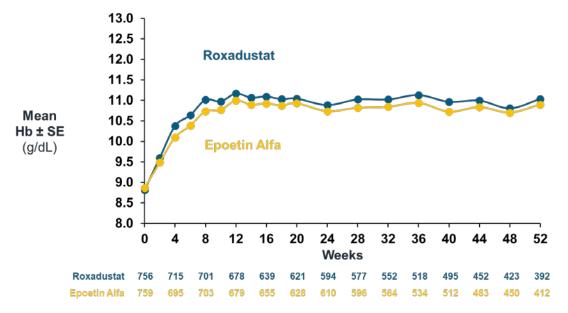

Figure 23: Pooled NDD Studies: Mean Hb and Weekly Roxadustat Dose During the Period of -3 to +6 Months Relative to Chronic Dialysis Initiation

Abbreviations: Hb=hemoglobin; NDD=non-dialysis-dependent; SE=standard error.

For the primary endpoint of mean change in Hb from baseline to the mean over Weeks 28 to 52, roxadustat was non-inferior to EPO in both the ID-DD population (Figure 24) and SDD population (Figure 25).

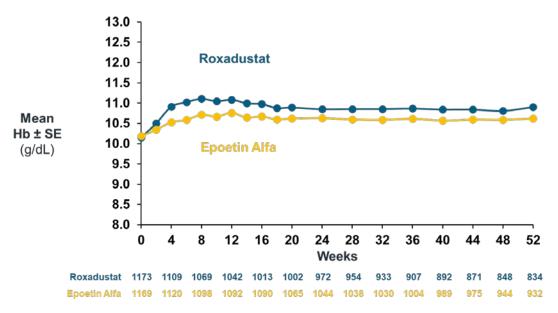

Figure 24: ID-DD Subpopulation: Mean Change in Hb from Baseline to Mean Over Weeks 28 to 52 Regardless of Any Rescue Therapy*

Abbreviations: ESA=erythropoiesis-stimulating agent; Hb=hemoglobin; ID-DD=incident dialysis-dependent; RBC=red blood cell; SE=standard error.

^{*}Rescue therapy consisted of RBC transfusion and ESA.

Figure 25: SDD Subpopulation: Mean Change in Hb from Baseline to Mean Over Weeks 28 to 52 Regardless of Any Rescue Therapy*

Abbreviations: ESA=erythropoiesis-stimulating agent; Hb=hemoglobin; RBC=red blood cells; SDD=stable dialysis-dependent; SE=standard error.

The benefits of roxadustat compared to EPO were also observed across key secondary endpoints in both the ID-DD and SDD populations. Patients in the roxadustat group received a significantly lower monthly amount of IV iron than those in the EPO group (p=0.0001), and a similar number of patients treated with roxadustat and with EPO required RBC transfusions (Table 4).

Table 4: ID-DD and SDD Populations: Mean Monthly IV Iron Use and Red Blood Cell Transfusion Requirement

	Incident Dia	lysis (ID-DD)	Stable Dialysis (SDD)	
	Roxadustat Epoetin alfa N=756 N=759		Roxadustat N=1173	Epoetin alfa N=1169
Mean Monthly IV Iron Use over Weeks 28 to 52, mg	53.6	70.2	51.4	64.89
RBC Transfusion; Patients (%)	6.1%	6.7%	11.8%	16.7%

Abbreviations: ID-DD=incident dialysis-dependent; IV=intravenous(ly); RBC=red blood cell; SDD=stable dialysis-dependent.

It is also important to examine the results of roxadustat among the subgroup of patients in the DD studies utilizing peritoneal dialysis as their modality (n=372 [9.6%]). Roxadustat was non-inferior to EPO among patients on peritoneal dialysis in the primary endpoint of change from baseline in Hb (Figure 26). In addition, patients receiving roxadustat received fewer RBC transfusions during the treatment period.

^{*}Rescue therapy consisted of RBC transfusion and ESA.

Figure 26: DD Subpopulation: LSMean Change from Baseline in Hb to Mean Over Weeks 28 to 52 and Time to First RBC Transfusion in Patients Receiving Peritoneal Dialysis

Abbreviations: CI=confidence interval; DD=dialysis-dependent; Hb=hemoglobin; LS=least square; RBC=red blood cell. *P-value not controlled for multiplicity.

Note: A total of 372 patients (9.6% of the enrolled DD population) were on peritoneal dialysis.

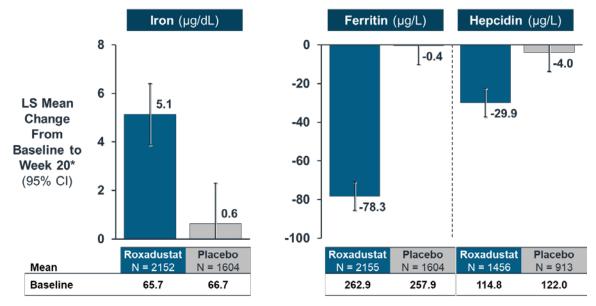

1.5. Hepcidin Reduction and Iron Mobilization

In patients with CKD undergoing ESA therapy, patients with systemic inflammation tend to have decreased response to ESA, requiring higher ESA doses to attempt to achieve target Hb. Whereas no singular definition of hyporesponse exists, studies show that patients have variable responsiveness to ESA longitudinally and 40% of patients enter the highest quintile of ESA dose at some point during a year. Inflammation also results in increased hepcidin and iron sequestration (Ganz 2003). The importance of iron availability is demonstrated in hemodialysis studies where higher ferritin values are achieved as an attempt to overcome iron restricted erythropoiesis and achieve target Hb levels without higher doses of ESAs. Unfortunately, patients with higher ferritin levels have the highest mortality rate (Bradbury et al 2009).

While somewhat similar to absolute iron deficiency, the obvious difference between absolute and functional iron deficiency is that in the latter clinical scenario more than sufficient iron is present in the body. This iron is however sequestered by hepcidin and not available to the organs including the bone marrow that utilize it. A growing number of studies have demonstrated better outcomes among patients with heart failure when iron is repleted using the IV route (Anker et al 2018). A potential outcome of hepcidin reduction is similarly to have a new availability of sufficient iron to organs that need it by decreasing its sequestration.

As shown in Figure 27, roxadustat increased serum iron compared to placebo in patients with NDD CKD. Importantly, this increase in serum iron occurred in the setting of less IV iron use in the roxadustat group compared to placebo likely due to increased absorption from the gastrointestinal tract as well as mobilization from previously sequestered stores. Patients receiving roxadustat also had a reduction in hepcidin and then ferritin. Hepcidin sequesters iron in the body where it cannot be delivered to the bone marrow. These findings support that roxadustat reduces hepcidin and increases iron availability to the bone marrow (as demonstrated by increasing serum iron and reduced ferritin).

Figure 27: Pooled NDD Studies: LSMean Change from Baseline to Week 20 in Iron, Ferritin, and Hepcidin Levels

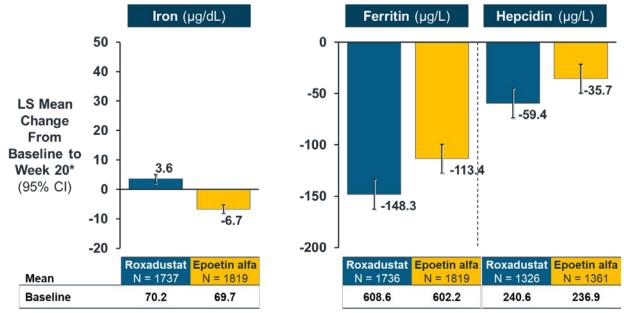

Abbreviations: CI=confidence interval; NDD=non-dialysis-dependent; LS=least square.

*Week 20=the mean of Weeks 12-28; hepcidin data are mean change from baseline to Week 24.

Note: Full analysis set.

Similar results were seen in the DD population (Figure 28). While serum iron was decreased in patients receiving EPO, serum iron was increased in the roxadustat group, despite less IV iron administration, lower rates of transfusion, and slightly higher Hb levels. As seen in the NDD studies, the increases in iron and reduction in ferritin with roxadustat suggest increased iron mobilization from previously trapped stores.

Figure 28: Pooled DD Studies: LSMean Change from Baseline to Week 20 in Iron, Ferritin, and Hepcidin Levels

Abbreviations: CI=confidence interval; DD=dialysis-dependent; LS=least square.

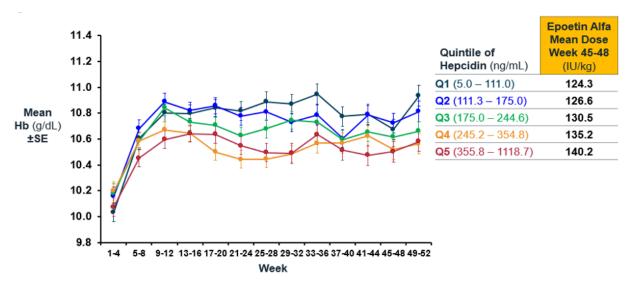

*Week 20=the mean of Weeks 12-28; hepcidin data are mean change from baseline to Week 24.

Note: Full analysis set.

Inflammation is a common occurrence in patients with DD CKD and leads to increased hepcidin levels. In the presence of high hepcidin levels, iron stores are less accessible to be transported by the blood to the bone marrow. Under normal conditions, serum ferritin levels correlate with total body stores of iron. In the presence of inflammation, iron is sequestered in intracellular stores such as macrophages and the reticuloendothelial system, resulting in functional iron deficiency. The treatment of anemia in patients with functional iron deficiency requires the mobilization of this sequestered iron for it to be accessible by the bone marrow (Macdougall et al 1992).

When examined by baseline quintiles of serum hepcidin, the Hb curves appeared to be clinically dissimilar among patients treated with EPO (Figure 29). Among patients with DD CKD treated with EPO, Hb levels in the patients in the 2 greatest hepcidin quintiles did not reach the same Hb levels as in the patients in the lower 3 hepcidin quintiles, despite higher EPO doses.

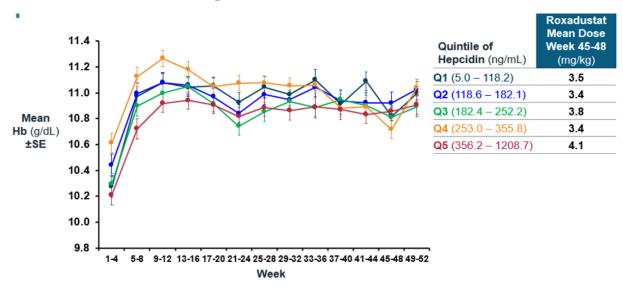

Figure 29: Pooled DD Studies: Mean Hb Levels by Quintiles of Hepcidin at Baseline in the Epoetin Alfa Group

Abbreviations: DD=dialysis-dependent; Hb=hemoglobin; SE=standard error.

However, in patients with DD CKD treated with roxadustat, the Hb levels achieved with were more similar across hepcidin quintiles (Figure 30). The data support that roxadustat efficacy was maintained across levels of hepcidin, whereas the efficacy of EPO was attenuated at the highest hepcidin levels.

Figure 30: Pooled DD Studies: Mean Hb Levels by Quintiles of Hepcidin at Baseline in the Roxadustat Group

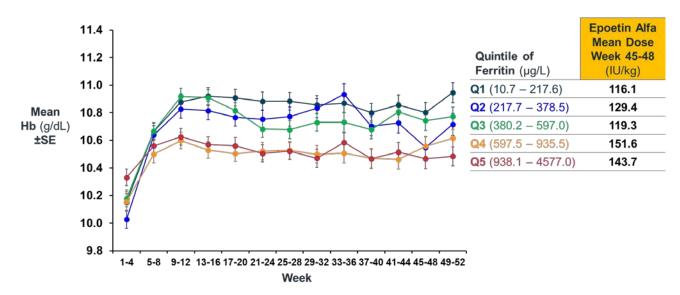

Abbreviations: DD=dialysis-dependent; Hb=hemoglobin; SE=standard error.

While the mean Hb among quintiles was approximately 0.5 g/dL lower among patients with DD CKD treated with EPO in the groups with the highest hepcidin levels, it must be emphasized that one of the central goals of anemia treatment is to minimize or avoid transfusion. Therefore, the impact of this difference in Hb must be examined relative to its association with transfusion risk.

Among patients with DD CKD who had the highest baseline levels of hepcidin, days with transfusions were reduced in the roxadustat vs EPO-treated patients: 11.6 per 100 PEY vs 21.3 per 100 PEY, respectively. As previously shown, hepcidin levels decreased among patients taking roxadustat. Consequently, there was more iron available making roxadustat a more effective treatment of anemia in these patients.

Similar relationships were seen when quintiles of ferritin at baseline were examined. Serum ferritin levels reflect intracellular stores of iron. In addition, in inflammation ferritin can be elevated as an acute phase reactant and can therefore be used as a marker of inflammation similar to CRP. An elevation in serum ferritin in the presence of anemia can suggest the presence of a functional iron deficiency. Similar to the stratification of Hb levels by hepcidin quintiles, patients with DD CKD treated with EPO in the highest 2 quintiles of ferritin at baseline had the lowest Hb levels over time (Figure 31), despite being treated with the highest EPO doses.

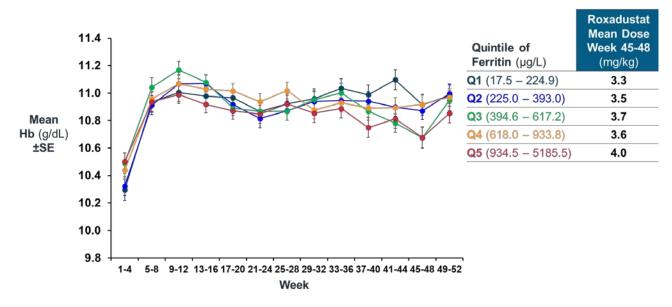

Figure 31: Pooled DD Studies: Mean Hb Levels by Quintiles of Ferritin at Baseline in the Epoetin Alfa Group

Abbreviations: DD=dialysis-dependent; Hb=hemoglobin; SE=standard error.

Similar to stratification of Hb levels by hepcidin quintiles, Hb levels in patients with DD CKD treated with roxadustat were similar across quintiles of ferritin (Figure 32).

Figure 32: Pooled DD Studies: Mean Hb Levels by Quintiles of Ferritin at Baseline in the Roxadustat Group

Abbreviations: DD=dialysis-dependent; Hb=hemoglobin; SE=standard error.

While the difference between the Hb values among patients in the various quintiles of serum ferritin were roughly 0.5 g/dL, the clinical significance of this difference is apparent in the association between these different Hb levels and risk of transfusion.

Among patients with DD CKD who had the highest baseline levels of ferritin, days with transfusions were reduced in the roxadustat vs EPO-treated patients: 12.5 per 100 PEY vs 21.5 per 100 PEY, respectively. This decrease is likely due to the availability of previously sequestered iron stores by reduction of functional iron deficiency.

Inflammation is a significant contributor to the etiology of anemia of CKD. Higher levels of systemic inflammation can contribute to worse and potentially more "treatment-resistant" anemia. Hyporesponsiveness has no single definition in the clinical nephrology community. However, it is characterized by a persistently low Hb level below the desired clinical goal. The roxadustat Phase 3 trials demonstrate the critical role that iron sequestration and functional iron deficiency caused by inflammation plays in the clinical scenario of hyporesponsiveness. Both hepcidin and high ferritin levels are markers of this phenomenon. Hepcidin is likely the mediator of iron sequestration and ferritin is the marker of the iron being sequestered. Patients who have the highest values of both do not achieve the same Hb levels when treated with EPO despite higher doses. Roxadustat, in contrast, effectively treats anemia in this hyporesponsive patient population with less requirement for blood transfusions. Consequently, roxadustat will be an important option for this population of patients with DD CKD.

1.6. Safety Findings (NDD and DD Population)

1.6.1. Cardiovascular Safety

The initial roxadustat Phase 3 program was designed to assess the efficacy and safety of roxadustat compared to placebo in NDD and compared to EPO in DD. Following the FDA's recommendation to

use major adverse cardiovascular event (MACE) defined as ACM, myocardial infarction, and stroke as the primary safety endpoint and to power for non-inferiority, Studies 001 and 002 were added. From the outset, Studies 001 and 002 were intended to contribute to a pooled assessment of CV safety and included the most comprehensive follow-up among the pivotal studies, whereas the initial Phase 3 studies were initially designed to demonstrate efficacy and safety without contributing to a pooled assessment of CV safety.

The CV safety of roxadustat was assessed using time to first adjudicated MACE, time to first MACE+ (MACE plus unstable angina requiring hospitalization and congestive heart failure requiring hospitalization) and time to ACM were also assessed, as well as time to CV mortality and the individual components of MACE+. Reported CV events and all deaths were sent to a blinded central Independent Event Review Committee (IERC) for adjudication. CV safety was assessed by pooling the pivotal studies for each population (001, 060, and 608 for NDD; 002, 063, and 064 for DD). The pooled population HR was estimated using the meta-analysis method to combine the HRs from the individual studies.

The program was designed to have sufficient power to ensure an upper bound of the 95% CI of the HR for MACE of < 1.3 for roxadustat compared to placebo in the NDD population and compared to EPO in the DD population. The upper bound of the 95% CI of the HR of 1.3 was chosen based on precedent from peginesatide and based on the consideration that HRs ≥ 1.3 were considered unacceptable in the Normal Hematocrit and CHOIR trials (Besarab et al 1998; Singh et al 2006). Indeed, the size of the roxadustat clinical program allowed for the generation of a large CV safety database, with more than 8,000 patients from 6 pivotal trials and approximately 1,500 total patients with MACE events in the primary analysis sets.

As discussed further below, results for Study 610, an NDD study with an active control, are presented in order to assess the CV safety of roxadustat vs ESA in NDD patients and to assess the CV safety of roxadustat in NDD patients in a clinical trial setting not affected by informative censoring.

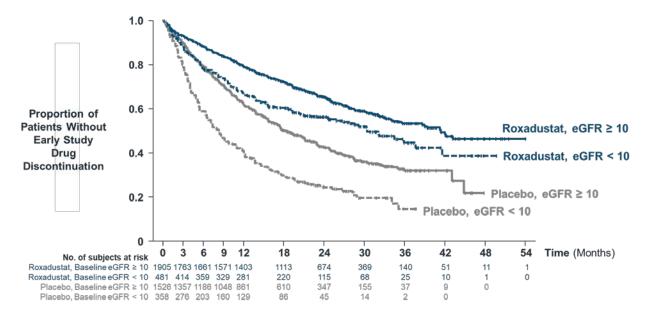

1.6.1.1. NDD Cardiovascular Safety Assessment

As expected, given the intended treatment population of patients with Hb < 10~g/dL, the NDD population consisted largely of patients with severe CKD at baseline. Eighty percent of patients had baseline eGFR < $30~mL/min/1.73~m^2$ (consistent with CKD Stage 4 or 5), and 42% had baseline eGFR < $15~mL/min/1.73~m^2$ (consistent with CKD Stage 5). When assessed by quintiles, the 20% of patients with the lowest baseline eGFR had baseline values < $10~mL/min/1.73~m^2$, which corresponds with the mean eGFR at the time of dialysis initiation in the US (USRDS 2020). As expected, dialysis initiation was common in the Phase 3 NDD program, with 34.7% of patients starting dialysis during the study.

• Placebo was selected as the comparator for the roxadustat NDD program due to the relative infrequency of ESA use in NDD CKD. However, given the severe CKD and high rates of dialysis initiation, many placebo patients required recurrent ESA rescue therapy, leading to large differences in treatment discontinuation between groups (Figure 33) with HR (95% CI) for early treatment discontinuation for roxadustat vs placebo of 0.49 (0.45–0.54). Although rates of discontinuation of placebo were consistently higher compared to roxadustat across subgroups, it was noted that differences were larger among patients with severe CKD, with placebo patients with baseline eGFR < 10 mL/min/1.73 m² being nearly 2.5-times as likely to discontinue treatment early compared to corresponding roxadustat-treated patients (HR for early treatment discontinuation of roxadustat compared to placebo 0.41, 95% CI: 0.34–0.50).

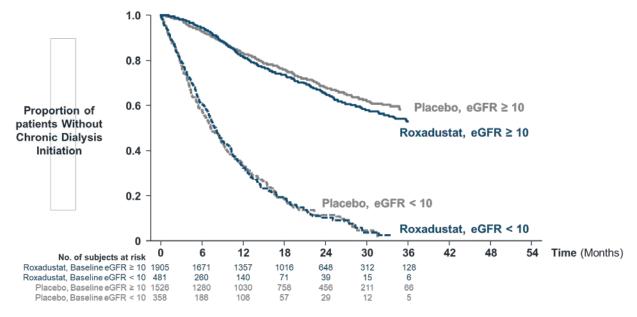

Figure 33 demonstrates this by showing the proportion of patients without early treatment discontinuation over time, including the patients with the lowest baseline eGFR $(< 10 \text{ mL/min/1.73 m}^2)$ and those with baseline values $\ge 10 \text{ mL/min/1.73 m}^2$. Because baseline eGFR < 10 mL/min/1.73 m² was associated with increased risk for MACE regardless of treatment group (HR compared to baseline eGFR ≥ 10: 1.44, 95% CI: 1.22–1.69), these findings have important implications for the CV safety assessment of roxadustat compared to placebo by demonstrating that high-risk patients were retained in the roxadustat group in ontreatment analyses but more likely to be censored from on-treatment analyses in the placebo group. These findings were also noted among patients with more severe anemia, as patients with baseline Hb of < 9 g/dL were much less likely to discontinue roxadustat- treatment early (HR 0.45, 95% CI: 0.39–0.52) and had higher MACE risk regardless of treatment group (HR compared to baseline Hb \geq 9 g/dL 1.47, 95% CI: 1.28–1.69) (Figure 34). In addition to the above, dialysis initiation was an important source of informative censoring (HR, 95% CI for early treatment discontinuation of roxadustat compared to placebo following dialysis initiation was 0.38, 0.32–0.46). As shown in Figure 34, dialysis initiation was common overall, particularly among patients with the lowest quintile of baseline eGFR.

Figure 33: Pooled NDD Studies: Proportion of Patients Without Early Study Drug Discontinuation over Time, by Treatment Group and Baseline eGFR

Abbreviations: eGFR=estimated glomerular filtration rate; NDD-non-dialysis-dependent Note: Safety Population, NDD Pool: Studies 001, 060, 608

Figure 34: Pooled NDD Studies: Proportion of Patients Without Dialysis Initiation over Time, by Treatment Group and Baseline eGFR

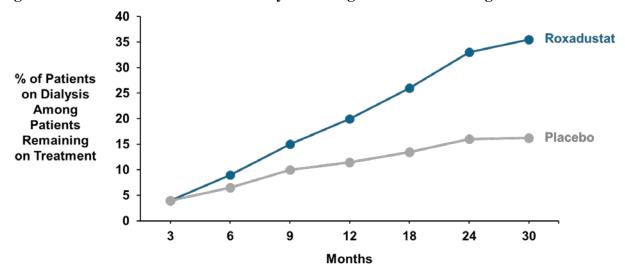

Abbreviations: eGFR=estimated glomerular filtration rate; NDD-non-dialysis-dependent.

Note: Safety Population, NDD Pool: Studies 001, 060, 608

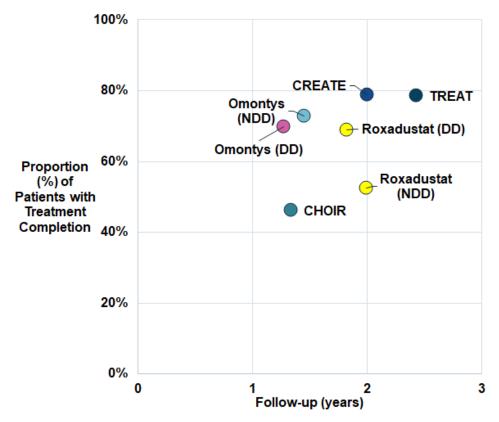

Cumulatively, these findings led to informative censoring of the highest CV risk placebo patients, with fewer high CV risk placebo patients remaining on treatment over time, leading to bias in favor of placebo. For example, over time, a substantially higher proportion of patients remaining on roxadustat treatment were patients who had initiated dialysis (Figure 35) due to placebo patients starting dialysis requiring ESA rescue therapy, compared to roxadustat patients generally having stable Hb values despite dialysis initiation. Because dialysis patients are at substantially higher risk for CV and other events including death, this is another important source of bias in on-treatment analysis. To address these biases, the Sponsor and FDA agreed to preferentially analyze NDD safety data using on-study analysis (also referred to as ITT analyses, including all MACE events accrued during the study, regardless of whether patients remained on treatment at the time of the event).

Figure 35: Percent of Patients on Dialysis Among Patients Remaining on Treatment

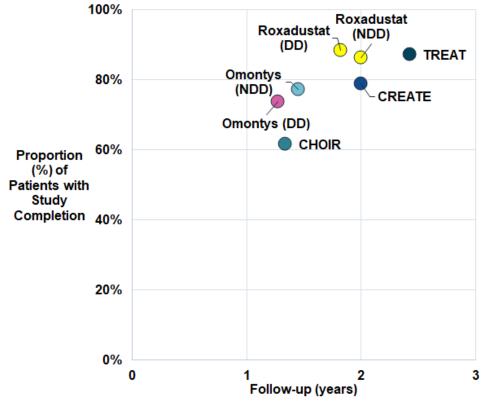

The approach to follow-up of MACE events and vital status after treatment discontinuation varied among the clinical trials. In Study 608, patients that discontinued treatment prematurely were assessed every 6 months until the end of the study for vital status, SAEs, and CV and thromboembolic events, unless consent was withdrawn. Study 060 conducted telephone visits every 3–6 months to assess for CV events, and Study 001 continued study visits with no change to safety data collection but allowed for modified follow-up such as telephone visits when necessary to avoid withdrawal of consent. The by-study and overall percentage of patients with treatment completion and complete follow-up for MACE and mortality are shown in Figure 38. Reasons for treatment discontinuation are presented in Table 59 in Section 10; patient decision was the most common reason for treatment discontinuation. Long-term follow-up of patients was more difficult than in other populations due to the patients' medical complexity and the high proportion of patients who started dialysis. These challenges have been observed with prior CKD anemia trials in both the NDD and DD populations, as shown in Figure 36 and Figure 37. Although the rates of treatment discontinuation in the roxadustat NDD pool were higher than most prior CKD anemia trials, it should be noted that the roxadustat NDD program differed from prior trials by enrolling a patient population with much more severe CKD who required dialysis initiation at higher rates; the rates of study discontinuation in the roxadustat NDD program were lower than most prior CKD anemia programs. Overall, 87.8% and 91.4% of patients had complete follow-up for MACE and vital status, respectively. Among the pivotal NDD trials, follow-up was most complete for Study 001 (Table 36 in Section 6.4.1).

Figure 36: Treatment Completion Rate in Roxadustat and Historical Anemia of CKD Trials

Figure 37: Study Completion Rate in Roxadustat and Historical Anemia of CKD Trials

Abbreviations: CHOIR=Correction of Hemoglobin and Outcomes in Renal Insufficiency trial; CKD=chronic kidney disease; CREATE=Cardiovascular Risk Reduction by Early Anemia Treatment with Epoetin Beta; DD=dialysis-dependent; NDD=non-dialysis-dependent; TREAT=Trial to Reduce Cardiovascular Events with Aranesp Therapy. Source: Wanner et al 2005; Fellström et al 2009; Singh et al 2006; Drüeke et al 2006; Fishbane et al 2013; Evolve Trial Investigators 2012; Macdougall et al 2013; Macdougall et al 2019; Pfeffer et al 2009.

Another way to assess follow-up is to evaluate mean follow-up time on treatment, mean follow-up time for MACE, and mean follow-up time for ACM. Table 5 shows these analyses by treatment group overall and Table 6 shows by treatment group and baseline eGFR. As expected, follow-up time ontreatment was substantially longer for roxadustat compared to placebo; however, follow-up time for MACE and ACM was comparable by treatment group. Ninety percent of MACE follow-up for roxadustat occurred during the OT+28 period, compared to 72% for placebo. This difference suggests that any amount of incomplete ascertainment of CV safety data following the on-treatment-period would be expected to lead to bias in favor of placebo in the ITT/on-study analysis, and that additional analyses which include a more balanced proportion of observation time occurring on treatment could further reduce bias due to differential treatment discontinuation. On review of the data by baseline eGFR, it is noted that the proportion of overall on-study/ITT follow-up that occurred during the ontreatment period is more consistent in the roxadustat group, and that follow-up time on treatment (and proportion of on-study/ITT follow-up time which occurred on-treatment) was particularly low among placebo patients with baseline eGFR < 10 mL/min/1.73 m². In sum, this analysis confirms the potential for informative censoring and bias favoring the placebo group in the OT+28 period, which will be attenuated in the ITT/on-study analysis.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

The overall on-study analysis includes time when patients from both treatment groups were on dialysis and time when a high proportion of placebo patients had converted to ESA. In order to focus on the clinical question of the CV safety of roxadustat compared to placebo in patients not on dialysis, "NDD-NDD" results are presented, which censor at dialysis initiation for patients who initiated dialysis during the study. It is acknowledged that this analysis has limitations due to censoring at a post-randomization event. Additionally, on-study results for patients with baseline eGFR ≥ 10 mL/min/1.73 m² are presented as supportive analyses to focus on the 80% of patients most likely to remain dialysis independent and who are less affected by differences in treatment discontinuation. As shown in Table 6, differences in on-treatment vs off-treatment follow-up time were less pronounced in this subgroup. Finally, results from Study 001 are shown as well as the pooled results because this study had the most complete follow-up for CV safety and mortality events.

Table 5: Mean Follow-up Time in Years, in On-treatment Plus 28 Days (OT+28) Analysis Set for MACE and ACM

	Follow-up Time/Patient, Roxadustat			Follow-up Time/Patient, Placebo		
	OT-28	MACE	ACM	OT-28	MACE	ACM

1.6.1.1.1. NDD Cardiovascular Safety Results

Figure 38 shows treatment discontinuation and ascertainment of MACE and ACM for the pooled NDD population. Sixty-two percent of roxadustat patients completed treatment compared to 40% of placebo patients, and a similar proportion of patients in each group had complete follow--up for MACE and ACM.

Figure 38: Pooled NDD Studies: Retention and Follow-up

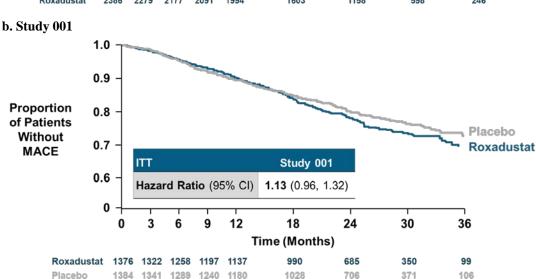

Abbreviation: NDD=non-dialysis-dependent.

The Kaplan-Meier survival analysis plots for the endpoint of MACE shows the probability of remaining event-free over time for the pooled NDD program and for the largest study in the program (Study 001), which had the most comprehensive follow-up of CV safety. The HR (95% CI) for MACE for roxadustat compared to placebo was 1.10 (0.96–1.27), in the pooled NDD assessment, and the results for Study 001 were consistent with the pooled results (Figure 39).

a. Pooled NDD Studies

Figure 39: Pooled NDD Studies: Kaplan-Meier Curves of Primary Analysis of MACE

0.9 Placebo Proportion 8.0 of Patients Without MACE 0.7 Roxadustat MACE NDD Pool 0.6 Hazard Ratio (95% CI) 1.10 (0.96, 1.27) 0.0 36 18 30 0 12 24 Time (months) 1237 1884 1802 1686 1596 1508 851 428 142 2386 2279 1994 1603 1158 598 246

Abbreviations: CI=confidence interval; ITT=intent-to-treat analysis set; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); NDD=non-dialysis-dependent.

Note: Safety Population; On-study analysis, NDD Pool: Studies 001, 060, 608, hazard ratio upper bound of 95% CI below reference margin of 1.3.

Figure 40 shows risk for MACE, MACE +, and ACM for roxadustat compared to placebo. HR point estimates range from 1.07–1.10, with 95% CIs crossing 1.0 and with 95% CI upper bounds ranging from 1.21–1.27 (Figure 40, top panel). When the data are censored at dialysis initiation (NDD-NDD), HR point estimates were nearly 1.0 (Figure 40, middle panel) and 95% CI upper bounds ranged from 1.19–1.21. This analysis includes 568 patients with MACE events and is considered important for assessing the CV safety of roxadustat for patients not on dialysis. Upon evaluation of the approximately 80% of total patients with baseline eGFR \geq 10 mL/min/1.73 m², who were less affected by differences in treatment discontinuation and who were less likely to start dialysis during the program, HR point estimates were also close to 1.0 (Figure 40, bottom panel).

Abbreviations: ACM=all-cause mortality; CI=confidence interval; eGFR=estimated glomerular filtration rate; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); MACE+=m MACE, plus hospitalization for unstable angina or congestive heart failure; NDD=non-dialysis-dependent. Note: Safety Population; On-study analysis (Studies 001, 060, 608; N=4,270); hazard ratio upper bound of 95% CI below reference margin of 1.3.

Results for Study 001 were consistent with the pooled results, for on-study NDD, on-study NDD with censoring at dialysis initiation, and on-study NDD with baseline eGFR \geq 10 mL/min/1.73 m² (Table 38).

The NDD program was not powered for the comparison of CV mortality or MACE+ components for roxadustat and placebo, and in particular there were relatively few myocardial infarction and stroke events during the program. HR point estimates varied by endpoint, however 95% CIs crossed 1.0 for all endpoints (Table 7).

 $Abbreviations: CI=confidence\ interval;\ HR=hazard\ ratio;\ NDD=non-dialysis-dependent.$

Note: Safety Population; On-study analysis (Studies 001, 060, 608; N=4270)

Figure 41 shows MACE results presented above, as well as overall on-treatment MACE and on-treatment MACE in patients with baseline eGFR ≥ 10 mL/min/1.73 m². The on-treatment analyses are heavily influenced by bias due to informative censoring in the placebo group and are not considered representative of the CV safety profile of roxadustat. The overall on-study/ITT HR for MACE was 1.10. On-study analyses with censoring at dialysis initiation, and of the subgroup of patients with baseline eGFR of ≥ 10 mL/min/1.73 m² were less affected by differential treatment discontinuation and had MACE HR point estimates of 1.02 and 1.00, respectively.

Figure 41: Pooled NDD Studies: Results for MACE Vary Due to Impact of Differential Treatment Discontinuation

 $Abbreviations: eGFR = estimated \ glomerular \ filtration \ rate; \ MACE = major \ adverse \ cardiovascular \ event \ (all-cause \ mortality, \ myocardial \ infarction, \ and \ stroke); \ NDD = non-dialysis-dependent.$

Note: Safety Population; OT+28 analysis or On-study analysis (Studies 001, 060, 608; N=4270)

Although ESAs are used infrequently in NDD CKD anemia, they are approved for use in the US, and the placebo-controlled NDD program does not directly address the question of the CV safety of roxadustat compared to ESAs in this population. Study 610 is considered informative due to its unique

design as an active-controlled (darbepoetin alfa) NDD study which is not affected by substantial differences in study drug discontinuation and informative censoring. The CV safety results for 610 showed MACE, MACE+, and ACM with HR point estimates ranging from 0.81–0.90 (Figure 42).

Figure 42: Study 610: Forest Plot of Primary Analysis of MACE, MACE+, and ACM

Abbreviations: ACM=all-cause mortality; CI=confidence interval; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalization for unstable angina or congestive heart failure; NDD=non-dialysis-dependent; OT+28=on-treatment plus 28 days. Note: Safety Population, OT+28 analysis.

1.6.1.2. DD Cardiovascular Safety Assessment

In agreement with FDA, the pooled CV safety assessment of roxadustat in patients with DD CKD anemia is based on Studies 063, 064, and 002. Each of these studies compared open-label roxadustat to open-label EPO. The Phase 3 study, Study 613, had a different design and is assessed separately.

The DD population consisted of patients from Studies 063, 064, and 002. Study 063 was a study of ID patients randomized within 4 months following dialysis initiation. These patients were untreated with ESA at baseline, had low Hb levels, and required anemia correction followed by maintenance. Study 064 was a study of prevalent dialysis (mean 3.9 years) patients treated with stable doses of ESA at baseline, and with Hb values of 9–12 g/dL. These patients were randomized to either continued maintenance anemia treatment with ESA, or conversion to roxadustat followed by titration and maintenance. Study 002 was the largest study in the program and contained a mix of incident and prevalent dialysis patients, and a mix of patients treated and untreated with ESA at baseline.

The ID subpopulation is considered to be a clinically relevant population because anemia treatment is most commonly initiated in conjunction with dialysis initiation, and because these patients were generally untreated with ESA at baseline or had recently been initiated on ESA. By contrast, most prevalent—or stable—dialysis patients had been on ESA treatment long-term, and these patients commonly had baseline Hb values within target ranges on low doses of ESA. The population of stable dialysis patients studied in the roxadustat program thus represents a population where transition to a different anemia therapy may not be clinically warranted for many patients. Therefore, the Sponsor considers that incident dialysis data are important for the assessment of the cardiovascular safety of roxadustat in patients with DD CKD.

1.6.1.2.1. DD Cardiovascular Safety Results

Figure 43 shows treatment discontinuation and ascertainment of MACE and ACM for the pooled DD population. Sixty-six percent of EPO-treated patients completed treatment compared to 58% of roxadustat-treated patients, and a similar proportion of patients by treatment group had complete follow-up for MACE and ACM. Reasons for treatment discontinuation, and treatment discontinuation in the ID and SDD subpopulations are presented in Table 60 in Section 10. Treatment discontinuation was more balanced by treatment group in the ID compared to the SDD subgroup. "Withdrawal by patient" was the most common reason for treatment discontinuation. As shown in Figure 36 and Figure 37, the incidence of early treatment discontinuation was comparable to prior large NDD and DD CKD anemia trials, and the rates of study discontinuation were generally lower in the roxadustat DD CKD program.

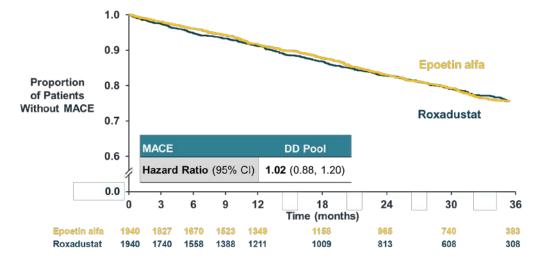

Figure 43: Pooled DD Studies: Retention and Follow-up

Roxadustat	NDD Pool	Epoetin Alfa

→ N = 1719 (89%)	Complete MACE Follow-Up N = 3458 (89%)	N = 1739 ← (90%)
→ N = 1762 (91%)	Complete Mortality Follow-Up N = 3547 (91%)	N = 1785 ← (92%)

Abbreviation: DD=dialysis-dependent.

The Kaplan-Meier survival analysis plot for the endpoint of MACE shows the survival curves of the 2 groups tracking closely (Figure 44). Results for additional analysis sets are provided in Section 6.4.2.

Figure 44: Pooled DD Studies: Kaplan-Meier Curves of Primary Analysis of MACE

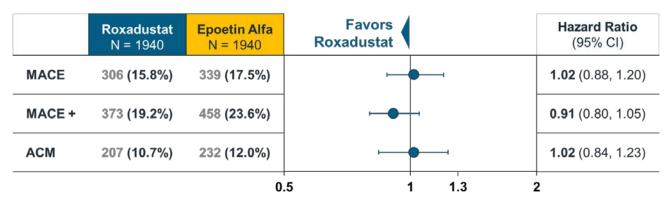

Abbreviations: CI=confidence interval; DD=dialysis-dependent; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); OT+7=on-treatment plus 7 days.

Note: Safety Population; OT+7 analysis (Studies 002, 063, 064, N=3880).

CV safety findings in the DD population were comparable between roxadustat and EPO. The forest plot presenting primary analysis of MACE, MACE+, and ACM shows HR point estimates ranging from 0.91–1.02, with 95% CIs crossing 1.0 and 95% CI upper bounds of 1.05–1.23 (Figure 45). Additional CV safety results in the DD population are presented in Section 6.4.2.

Figure 45: Pooled DD Studies: Forest Plot of Primary Analysis of MACE, MACE+, and ACM

Abbreviations: ACM=all-cause mortality; CI=confidence interval; DD=dialysis-dependent; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalization for unstable angina or congestive heart failure

Note: Safety Population; OT+7 analysis (Studies 002, 063, 064, N=3880)

Incidence rates of MACE+ individual components were generally similar for roxadustat and EPO, and numerically lower for hospitalization for congestive heart failure in roxadustat-treated patients (Table 8).

Tuble of Toolea DD Staalest Mile D1 Components	Table 8:	Pooled DD Studies: MACE+ Components
--	----------	--

Abbreviations: CI=confidence interval; DD=dialysis-dependent; HR=hazard ratio; MACE+=major adverse cardiovascular event including hospitalizations for either unstable angina and/or congestive heart failure; OT+7=on-treatment plus 7 days.

Note: Safety Population; OT+7 analyses (Studies 002, 063, 064, N=3880)

To further evaluate the results in patients with ID and SDD CKD, pooled analyses were performed. It should be noted that these analyses were not powered for non-inferiority. Figure 46 shows the proportion of ID patients without MACE over time for roxadustat compared to EPO. Although the 95% CI crossed 1.0, the curves for the proportion of patients without MACE appeared to separate over time, and the HR point estimate for MACE was 0.82 for roxadustat compared to EPO.

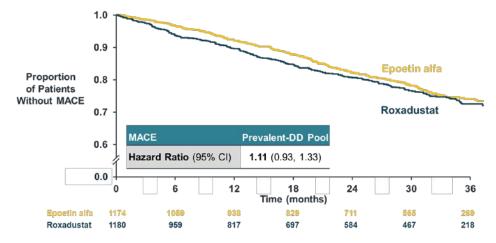

Figure 46: ID-DD Subpopulation: Kaplan-Meier Curve of Primary Analysis of MACE

Abbreviations: CI=confidence interval; ID-DD=incident dialysis dialysis-dependent; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); OT+7=on-treatment plus 7 days. Note: Safety Population; OT+7 analyses (Studies 002, 063, 064, N=1526 for patients on dialysis for \leq 4 months at the time of randomization)

The Kaplan-Meier survival analysis plot for MACE shows similar curves in MACE for roxadustat and EPO in SDD or prevalent dialysis patients (Figure 47). The HR point estimate was 1.11, with a 95% CI crossing 1.0.

Figure 47: SDD-DD Subpopulation: Kaplan-Meier Curve of Primary Analysis of MACE

Abbreviations: CI=confidence interval; SDD=stable dialysis-dependent; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); OT+7=on-treatment plus 7 days.

Note: Safety Population; OT+7 analyses (Studies 002, 063, 064, N=2354 for patients on dialysis for > 4 months at the time of randomization).

1.6.1.3. Analysis of Pooled DD Studies With and Without Study 613

Figure 48 shows CV safety results for the pooled DD studies with and without Study 613. Study 613 was a study of stable dialysis patients on ESA at baseline. Patients on short-acting ESAs were randomized to roxadustat or EPO, whereas patients on long-acting ESA were randomized to roxadustat or darbepoetin. In agreement with FDA, Study 613 was not pooled with the other 3 Phase 3 trials for the NDA because it randomized to roxadustat and 2 different ESAs, which may have different profiles. The results for Study 613 are shown in Figure 71, and the pooled DD analysis including Study 613 is presented below.

Favors DD Pool Excludes Roxa **EPO Hazard Ratio** N=1940 Roxadustat Study 613 N = 1940(95% CI) MACE 306 (15.8%) 339 (17.5%) **1.02** (0.88, 1.20) MACE+ 373 (19.2%) 458 (23.6%) **0.91** (0.80, 1.05) **All-Cause Mortality** 207 (10.7%) 232 (12.0%) **1.02** (0.84, 1.23) **DD Pool Includes** Roxa **ESA Hazard Ratio** Study 613 N=2354 N=2360 (95% CI) MACE 371 (15.8%) 398 (16.9%) 1.08 (0.93, 1.24) MACE+ 445 (18.9%) 524 (22.2%) 0.97 (0.85, 1.10) **All-Cause Mortality** 264 (11.2%) 277 (11.7%) **1.11** (0.94, 1.32) 0.5 2 1.3

Figure 48: Analysis of Pooled Dialysis Studies With and Without Study 613

Abbreviations: ACM=all-cause mortality; CI=confidence interval; DD=dialysis-dependent; EPO=epoetin alfa; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalization for unstable angina or congestive heart failure OT+7=on-treatment plus 7 days; Roxa=roxadustat. Note: Safety Population; OT+7 analysis

As expected, based on the effect of including Study 613 in the pooled analysis, Study 613 is an outlier compared to the pivotal DD studies (Figure 49; MACE+ and ACM are shown in Figure 71).

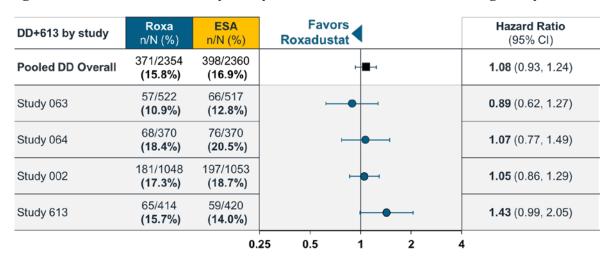

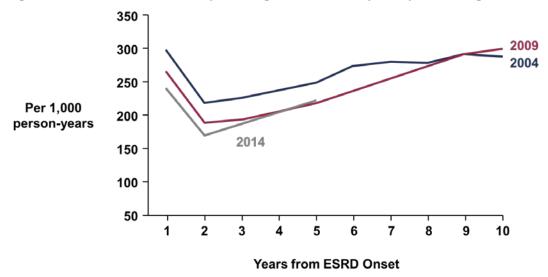

Figure 49: MACE Results by Study for Pivotal DD Studies Including Study 613

Abbreviations: CI=confidence interval; DD=dialysis-dependent; ESA=erythropoietin-stimulating agent; Roxa=roxadustat.

In addition to the differences in trial design as discussed above, analysis of demographic and baseline characteristics showed apparent baseline imbalances by treatment group design in Study 613 (Table 54). Such imbalances were not noted in the pivotal DD studies, and several of the noted imbalances in Study 613 were in baseline characteristics known to be associated with CV risk, suggesting that the treatment groups may not have had balanced CV risk at baseline. Notably, dialysis

vintage (time since initiation of dialysis) differed by treatment group. Dialysis vintage is important prognostically. As shown in Figure 50, there is a "U-shaped" association between mortality and dialysis vintage in US patients, with high mortality rates in the ID period, which decline sharply until ~2 years following randomization, then increasing to rates which approach rates in the ID period by ~5 years following dialysis initiation. These results demonstrate how the observed differences in mean dialysis vintage in Study 613 could lead to confounding in the assessment of CV safety for roxadustat versus the comparators (Table 54).

Figure 50: Rate of Mortality Among US Patients by Dialysis Vintage

Abbreviation: ESRD=end-stage renal disease.

Source: USRDS 2020

1.6.1.4. Cardiovascular Safety Conclusions

The CV safety of roxadustat is comparable to placebo in NDD CKD and to EPO in DD CKD. The CV safety results of the roxadustat NDD program should be interpreted in the context of the use of the placebo comparator. By contrast, prior seminal ESA NDD trials have generally used ESA as comparator, with the notable exception of TREAT, which showed an increased risk of stroke for darbepoetin compared to placebo. Notably, the NDD Study 610 compared roxadustat to darbepoetin alfa.

The CV safety results in the NDD program are affected by informative censoring of placebo patients, with higher-risk patients being more likely to prematurely discontinue placebo than corresponding roxadustat patients who were more likely to continue treatment. The pooled NDD on-study analyses showed HR point estimate of 1.10 with a 95% CI that crossed 1.0, with upper bound of 1.27. Supportive results in patients with baseline eGFR \geq 10 mL/min/1.73 m², and in patients censored at dialysis initiation, which the Sponsor considers to be less affected by informative censoring, showed HR point estimates close to 1.0, with 95% CIs crossing 1.0. In addition, CV safety results of Study 001, which was the largest pivotal NDD study that had the most complete follow-up for CV events after treatment discontinuation, were consistent with the pooled results.

The non-pooled NDD Study 610 that was notable for being active controlled (darbepoetin alfa), rather than placebo controlled, showed MACE, MACE+, and ACM HR point estimates of 0.81, 0.90, 0.83, respectively, with 95% CIs crossing 1.0.

The pooled DD results show comparable CV safety profiles in roxadustat compared to ESA, particularly in the clinically relevant subgroup of ID patients.

1.6.2. Adverse Events

The AE profile of roxadustat was generally comparable to placebo in patients with NDD CKD and to EPO in patients with DD CKD (Table 9), with some exceptions as noted below. Informative censoring also affected the interpretation of AEs in the NDD population. To account for differences in study drug exposure per treatment group in this population, exposure-adjusted incidence rates are presented in addition to incidence. However, this does not account for overrepresentation of higher-risk patients in the roxadustat group for on-treatment analyses. AE profiles and lists of most commonly reported AEs are presented in Section 6.5.

Table 9: NDD and DD Studies: Overview of Adverse Events

		dustat 2386	Placebo N=1884

Note: Safety Population, OT+28 analysis; NDD Pool=Studies 001, 060, 608, DD Pool=Studies 002, 063, 064

1.6.3. Safety Assessment of Specific Adverse Events

The following AEs have been selected because they have either been previously observed as risks with anemia treatment or because safety imbalances were noted in the roxadustat clinical development program.

1.6.3.1. Thrombosis

Across the randomized NDD and DD populations, the types of thrombosis events reported were typical of those observed in the CKD population, with no imbalances in rare or atypical thrombotic events. However, for both the NDD and DD populations, there were higher numbers of vascular access thrombosis (VAT) and deep vein thrombosis (DVT), in the roxadustat groups than the comparator groups.

For both the NDD and DD populations, there were higher numbers of VAT and venous thrombosis events, specifically DVT, in the roxadustat groups than the comparator groups.

Mechanistically, the risk of thrombosis was associated with rapid increases in Hb levels (defined within the roxadustat program as Hb increase > 2 g/dL over a 4-week period) in the clinical program. In the non-clinical program, thrombotic events were associated with excessive erythropoiesis (hematocrits > 68% and Hb > 20 g/dL) in toxicology studies after long-term roxadustat dosing in healthy animals, though they were at higher doses than what were used in the clinical program.

Summaries of VAT and DVT are provided below.

1.6.3.1.1. Vascular Access Thrombosis

In patients with ESRD receiving hemodialysis, thrombosis is a common cause of dysfunction of a vascular access, including arteriovenous fistula (AVF) and arteriovenous graft (AVG).

All VAT-related AEs reported by the investigators were adjudicated by the IERC. Overall, there was a higher number of (positively) adjudicated VAT events in the roxadustat versus comparator groups across the NDD and DD populations. In the NDD pool, the incidence rate of adjudicated VAT events in the roxadustat versus placebo groups was 1.5 patients with events/100 PY vs 0.9 /100 PY in onstudy analyses, respectively, and 1.5 /100 patient years (PY) vs 0.3 /100 PY in OT+28, respectively. However, in the NDD program, patients typically do not have dialysis access at baseline, and patients requiring dialysis were noted to discontinue placebo at higher rates compared to roxadustat. These circumstances make the NDD VAT data difficult to interpret, and hence the interpretation of VAT data from the roxadustat program is focused on the results in the DD population, where the incidence of adjudicated VAT events in the roxadustat versus EPO groups was 13.0% vs 10.5%, respectively (Table 10).

Table 10: NDD and DD Studies: Adjudicated VAT Adverse Events

	Roxadustat N=2386		Placebo N=1884	
NDD Population	n (%)	n (%) IR/100 PY		IR/100 PY
Vascular Access Thrombosis (OT+28)	58 (2.4)	1.5	7 (0.4)	0.3
	Roxadustat N=1940		Epoetin Alfa N=1940	
DD Population	n (%)	n (%)
Vascular Access Thrombosis (OT+28)	252 (13.0)		204 (10.5)	
Baseline arteriovenous fistula	120/794 (15.1)		92/745	5 (12.3)
Baseline arteriovenous graft	30/76 (39.5) 18/70 (25		(25.7)	

Abbreviations: DD=dialysis-dependent; IR=incidence rate; NDD=non-dialysis-dependent; OT+28=on-treatment plus 28 days; PY=patient year.

Note: Safety Population, OT+28 analysis; NDD Pool: Studies 001, 060,608; DD Pool: Studies 002, 063, 064

A limitation to the VAT analyses in the DD pool is that vascular access status was not systematically collected at baseline. However, based on their surgical history, 42% of patients in the DD pool had a documented AVF or graft at baseline, including 841 roxadustat-treated patients and 795 EPO-treated patients. When limiting the analysis to patients with a documented AVF at baseline, 15.1% of roxadustat compared to 12.3% of EPO patients had a VAT event, compared to 39.5% and 25.7% of roxadustat and EPO patients, respectively, with documented AVG at baseline.

In patients with VAT, demographics and baseline disease characteristics were similar between treatment groups. In addition, VAT rates across treatment groups were proportionally greater in the subgroup of patients with known risk factors of VAT (eg, history of cardiovascular/cerebrovascular/thromboembolic disease, diabetes, and obesity).

Rates of VAT in the roxadustat group were highest, and the difference between treatment groups was largest, during the first 12 weeks of the study following randomization (Figure 51). The rates of VAT were noted to decrease over time in both treatment groups, but to a proportionally greater extent in roxadustat-treated patients, and differences in event rates were noted to be of a lesser magnitude, at later compared to earlier time points in the study.

Roxadustat **Epoetin Alfa** 20 15 13.6 Incidence 11.3 10.3 of VAT 10 9.0 (IR/100 PEY) 7.8 7.3 6.7 5.3 5 ≤12 >12 - ≤24 >24 - ≤52 >52 ≤12 >12 - ≤24 >24 - ≤52 >52 Time of Onset (Weeks) Time of Onset (Weeks)

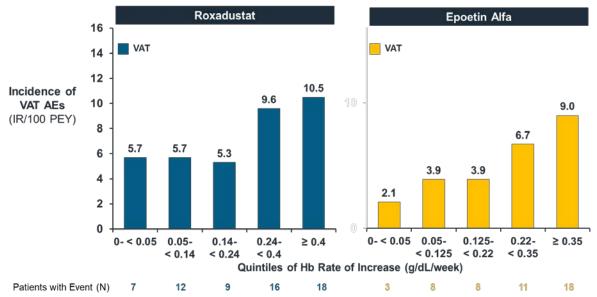

Figure 51: Pooled DD Studies: Adjudicated VAT Adverse Events by Time of Onset

Abbreviations: DD=dialysis-dependent; IR=incidence rate; OT+7=on-treatment plus 7 days; PEY=patient exposure year; VAT=vascular access thrombosis.

Note: Safety Population, OT+7 analysis; DD Pool: Studies 002, 063, 064

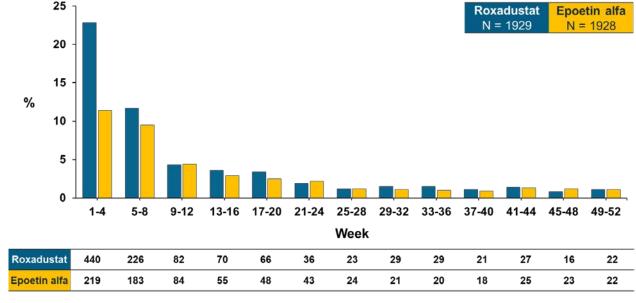

VAT risk was highest with roxadustat treatment early in the studies (Figure 51) when Hb values rose most quickly. During this early study period, roxadustat treatment was associated with a higher Hb rate of rise compared to EPO, which may contribute to the higher observed VAT incidence in roxadustat compared to EPO. Supporting this contention, exploratory analyses indicated that a more rapid rate of Hb rise was associated with a higher risk of VAT events in both roxadustat and EPO groups (Figure 52). Consequently, the higher rate of Hb rise in roxadustat-treated patients may explain the higher VAT risk compared to EPO. Based on this assessment, adjustments to roxadustat starting dose are expected to lower the rate of Hb rise, which will mitigate the risk of VAT.

Figure 52: Pooled DD Studies: Incidence of VAT with Increasing Hb Rate of Increase

Abbreviations: AE=adverse event; DD=dialysis-dependent; Hb=hemoglobin; IR=incidence rate; OT+7=on-treatment plus 7 days; PEY=patient exposure year; VAT=vascular access thrombosis. Note: Safety Population, OT+7 analysis; DD Pool: Studies 002, 063, 064

Figure 53: Pooled DD studies: Proportion of Patients with First Occurrence of Hb Rate of Rise > 2 g/dL within Any 4-Week Period Over Time at Each Visit up to Week 52

Abbreviation: DD=dialysis-dependent.

Note: Full Analysis Set Population, DD Pool: Studies 002, 063, 064.

With respect to the clinical impact in patients with VAT, no patients were reported to discontinue roxadustat due to a VAT event. In addition, the majority of patients with a VAT event did not have a recurrence of the event (71.0% and 70.6% with roxadustat and EPO, respectively).

The risk of VAT associated with roxadustat can be mitigated by making appropriate modifications to the starting dose in order to decrease the incidence of rapid Hb rates of rise. The Sponsor intends to communicate and mitigate this increased risk of VAT in the product labeling. In addition, the importance of regularly monitoring Hb during treatment will be emphasized, in which Hb levels should be monitored at least every 2 weeks when initiating or adjusting therapy until levels are stable, after which monitoring would occur every 4 weeks.

1.6.3.1.2. Deep Vein Thrombosis and Pulmonary Embolism

Kidney disease is a known risk factor for venous thromboembolic events, in particular DVT and pulmonary embolism (PE), which is a complication of DVT. In one study of patients with DD CKD, the rate of DVT was 3.3/100 PY, while the rate of PE was 0.65/100 PY (Molnar et al 2018).

The overall incidence of DVT was low in the roxadustat pivotal studies; however, there was a higher number of DVT events in the roxadustat groups than the comparator groups across the NDD and DD populations. The rates of PE events in the roxadustat groups and comparator groups were low and comparable across the NDD and DD populations (Table 11).

Table 11: NDD and DD Studies: DVT and PE Adverse Events (OT+28)

Preferred Term	Roxac N=2		Placebo N=1884		
NDD Population	n (%) IR/100 PY		n (%)	IR/100 PY

Abbreviations: DD=dialysis-dependent; DVT=deep vein thrombosis; IR=incidence rate; NDD=non-dialysis-dependent; OT+28=on-treatment plus 28 days; PE=pulmonary embolism; PY=patient years.

Note: Safety Population, OT+28 analysis, NDD Pool: Studies 001, 060,608; DD Pool: Studies 002, 063, 064

Across treatment groups, demographics and baseline characteristics in patients with a DVT and/or PE were generally consistent with what is observed in patients at risk of venous thrombosis.

When assessing the clinical circumstances of these DVT occurrences, it is noted that many of the DVT events occurred around the time of hospitalization, a known at-risk setting for thrombotic events. For example, in the DD pool, 16 of 30 (53.3%) roxadustat-treated patients and 11 of 19 (57.9%) EPO-treated patients with a DVT had the event between 1 day after the patient was hospitalized and 30 days after hospital discharge.

With respect to the clinical impact in patients with DVT and PE, few events led to study treatment discontinuation (Table 12). The majority of patients recovered or were recovering without recurrence of the event, with most patients having received antithrombotic treatment for the event.

Table 12: NDD and DD Studies: Clinical Impact in Patients with DVT/PE

Similar to VAT, the Sponsor intends to communicate and mitigate this increased risk of DVT in the product labeling with clinical measures that include adjustments to the roxadustat dosing algorithm in order to decrease the incidence of rapid rates of Hb rise or excursions above target levels. In addition, the importance of regularly monitoring Hb during treatment will be emphasized, in which Hb levels should be monitored at least every 2 weeks when initiating or adjusting therapy until levels are stable, and then every 4 weeks. The clinician is also advised to consider withholding treatment for severe or life-threatening thrombosis and manage all thromboses promptly. In addition, the risk of DVT will be communicated in the Medication Guide to inform patients of the signs and symptoms associated with DVT and when to seek medical help.

1.6.3.2. Seizures

Seizures are more common among patients with CKD than the general population (Lakshman et al 2016). A standardized Medical Dictionary for Regulatory Activities query was conducted for convulsions to capture all preferred terms related to seizures. The incidence of seizures was higher in the roxadustat groups than the comparator groups across the NDD and DD populations (Table 13). The majority of the roxadustat-treated patients recovered with continued treatment and without seizure recurrence. The occurrence of seizures in roxadustat-treated patients was higher in a subset of patients with a baseline medical history of seizures. The Sponsor intends to mitigate this risk by providing 'Warnings and Precautions' about seizures in the product labeling as detailed in Section 1.6.

Table 13: NDD and DD Studies: Seizure Adverse Events

		ndustat 2386		acebo =1884
NDD Population	n (%)	IR/100 PY	n (%)	IR/100 PY

Abbreviations: AE=adverse event; IR=incidence rate; DD=dialysis-dependent; MedDRA=Medical Dictionary for Regulatory Activities; NDD=non-dialysis-dependent; OT+28=on-treatment plus 28 days; PY=patient years; SMQ=standardized MedDRA query.

Note: Safety Population, OT+28 analysis; NDD Pool: Studies 001, 060,608; DD Pool: Studies 002, 063, 064.

1.6.3.3. Serious and Fatal Infections

Infections are a common and important source of morbidity and mortality in patients with CKD. Risk for infections increases as CKD becomes more severe and is higher in dialysis compared to non-dialysis patients. In the roxadustat Phase 3 clinical program, AEs and serious AEs (SAEs) in the System Organ Class of Infections and Infestations were common in both treatment groups in the NDD and DD pools.

In the pooled NDD studies, the incidence rate of serious infections was 12.4 vs 10.6/100 PY for roxadustat and placebo in OT+28, respectively (Table 14). Adjudicated fatal infections were reported at a higher frequency in patients treated with roxadustat (1.4/100 PY in OT+28) than placebo (0.7/100 PY in OT+28). The majority (23/39) of fatal infections in the placebo group occurred following the on-treatment analysis period, which is not unexpected as the subpopulations of patients at a higher risk for infection were most affected by differential discontinuation of study drug. Importantly, the incidence of fatal infections was similar between roxadustat- and placebo-treated patients in the US (0.3/100 PY vs 0.5/100 PY, respectively); the imbalance between groups comes from the ex-US patient population (1.7/100 PY vs 0.7/100 PY, respectively).

In the pooled DD studies, adjudicated fatal infections were reported at a similar frequency in patients treated with roxadustat (2.4% in OT+28) compared to EPO (2.4% in OT+28) and serious infections were reported in 24.4% vs 24.6% of patients in OT+28, respectively. In contrast to the NDD studies, there was no difference in the incidence of fatal infection by treatment group.

Table 14: NDD and DD Studies: Infection Adverse Events

		Roxadustat N=2386		cebo 1884
NDD Population (On-Study)	n (%)	IR/100 PY	n (%)	IR/100 PY
Infection/Infestation AE (SOC)	1318 (55.2%)	50.8	942 (50.0%)	47.2
Infection/Infestation SAE (SOC)	509 (21.3%)	13.1	343 (18.2%)	12.1
Infection Death (adjudication)	87 (3.6%)	2.0	39 (2.1%)	1.2
NDD Population (OT + 28)	n (%)	IR/100 PY	n (%)	IR/100 PY
Infection / Infestation AE (SOC)	1255 (52.6%)	51.3	798 (42.4%)	47.4
Infection / Infestation SAE (SOC)	452 (18.9%)	12.4	243 (12.9%)	10.6
Infection Death (adjudication)	55 (2.3%)	1.4	16 (0.8%)	0.7
		Roxadustat N=1940		in Alfa 1940
DD Population (OT+28)	n (n (%)		%)
Infection/Infestation AE (SOC)	972 (972 (50.1)		(50.2)
Infection/Infestation SAE(SOC)	473 (473 (24.4)		(24.6)
Infection Death (adjudication)	47 ((2.4)	46 ((2.4)

Abbreviation: AE=adverse event; DD=dialysis-dependent; IR=incidence rate; NDD=non-dialysis-dependent; OT+28=on-treatment plus 28 days; PY=patient years; SAE=serious adverse event; SOC=System Organ Class. Note: Safety Population, OT+28 analysis; NDD Pool: Studies 001, 060,608; DD Pool: Studies 002, 063, 064.

The risk of serious infections, including fatal infections, in the NDD population increases with lower baseline eGFR. As shown in Table 15, patients in the roxadustat group with baseline eGFR < 10 mL/min/1.73 m² and those who had started dialysis had a higher incidence of fatal infections. Roxadustat patients with the lowest baseline eGFR and those who required dialysis initiation were substantially more likely to remain on study drug compared to placebo patients, which had the potential to introduce bias and may have contributed to the observed higher incidence rate of fatal infection in roxadustat patients in the NDD population. The incidence of fatal infection was similar for roxadustat and EPO in the DD population, and rates of serious infection were generally similar for roxadustat and comparator across the population.

Table 15: Pooled NDD Studies: Fatal Infection Adverse Events by Baseline eGFR

	OT+28				On-S	Study			
	Roxadu N=23					Roxadustat N=2386		Placebo N=1884	
	n/N (%)	IR	n/N (%)	IR	n/N (%)	IR	n/N (%)	IR

Abbreviations: eGFR=estimated glomerular filtration rate; ID=incident dialysis; IR=incidence rate; NDD=non-dialysis-dependent; OT+28=on-treatment plus 28 days.

Note: Safety Population, OT+28 analysis or On-study analysis (Studies 001, 060, 608, N=4270)

In the NDD Study 610, the incidence of infection SAEs was higher for roxadustat compared to darbepoetin alfa; however, the incidence rate of fatal infections was similar compared to darbepoetin alfa (see Section 7.2).

Overall, the fatal infection results from the pooled NDD studies are inconsistent with the fatal infection results for the pooled DD studies and Study 610 where incidence of fatal infection was similar for roxadustat and comparator, suggesting that bias due to differential treatment discontinuation may have confounded the fatal infection comparisons in the pooled placebo-controlled NDD studies.

The Sponsor intends to provide 'Warnings and Precautions' related to the potential risk of infection in the product labeling. More specifically, labeling language to suggest avoidance of initiating treatment with roxadustat in patients with an active severe or serious infection, advice to patients to promptly report to their healthcare provider if they have signs or symptoms of an infection, and if an infection is suspected, advice to the healthcare practitioner to evaluate the patient and treat promptly.

1.7. Risk Management

In the post-approval setting, the Sponsor has a comprehensive plan in place to enable rapid evaluation of the safety profile of roxadustat in order to characterize and communicate pertinent safety data appropriately to healthcare providers and patients. Safety outcomes that will be specifically monitored during the post-approval period include thrombotic events (eg, VAT and DVT), seizures, and serious infections. These risk management activities are described in further detail below, including recommendations for changes to roxadustat starting dose and planning for post-marketing studies.

1.7.1. Risk Minimization

The Sponsor plans to communicate all relevant safety information and recommendations for risk mitigation associated with the use of roxadustat in the product labeling (Prescribing Information) and

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

Medication Guide for healthcare providers and patients, respectively. The Sponsor also plans to communicate risks in educational materials for healthcare providers.

Important safety information includes:

- Thrombotic events (eg VAT and DVT): This risk can be mitigated by reducing starting doses in order to decrease the incidence of rapid Hb rates of rise (See Section 1.7.3). Monitor Hb during treatment (ie, when initiating or adjusting therapy, monitor Hb levels at least every 2 weeks until stable, then monitor every 4 weeks). Consider withholding for severe or life-threatening thrombosis and manage all thromboses promptly. Advise patients to contact their healthcare provider for signs and symptoms of thrombosis.
- Seizures: Advise patients to promptly report new onset seizures, premonitory symptoms, or
 increase in seizure frequency or severity to their healthcare provider. Patients with a history of
 seizure should be treated with caution.
- Serious Infections: Avoid starting roxadustat in patients with an active severe or serious infection. Monitor patients for signs and symptoms of infection and promptly treat. Advise patients to contact their healthcare provider for signs and symptoms of an infection.

1.7.2. Post-marketing Surveillance

Safety risks will continue to be monitored and evaluated in the post-approval setting, and will include the following:

- Adverse event reporting: All individual case safety reports from spontaneous sources will
 captured in a validated safety database and relevant cases (eg, SAEs) will be reported to FDA's
 Adverse Event Reporting System. For spontaneous reports, targeted follow-up questionnaires
 will be used to collect additional specific information for events of interest (ie, DVT, VAT,
 seizures, serious infections).
- Safety signal management: Safety surveillance and signal detection activities, which includes a
 monthly screening and evaluation of the Sponsor's global safety database assessing serious and
 non-serious AEs reported from all sources (eg, clinical trials, spontaneous) will be performed.
 In addition, monthly safety assessments evaluate the global medical and scientific literature
 with regards to non-clinical and clinical reports. Review of global health authority safety
 databases (eg, FDA's Adverse Event Reporting System and Vigibase) are also conducted when
 potential signals are evaluated. Any confirmed signals will be communicated with the FDA.
- Aggregate Reports: Cumulative reviews of events of interest will be summarized in periodic reports (eg, Periodic Benefit-Risk Evaluation Report) and will be submitted to the FDA.

In addition to the activities listed above, the Sponsor is evaluating potential activities to characterize thrombosis risk with roxadustat treatment in the real-world setting at the newly recommended dosing regimen.

The Sponsor will continuously evaluate, communicate, and mitigate known risks associated with the use of roxadustat. The Sponsor is also committed to working with the FDA on the development and implementation of appropriate activities/measures.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

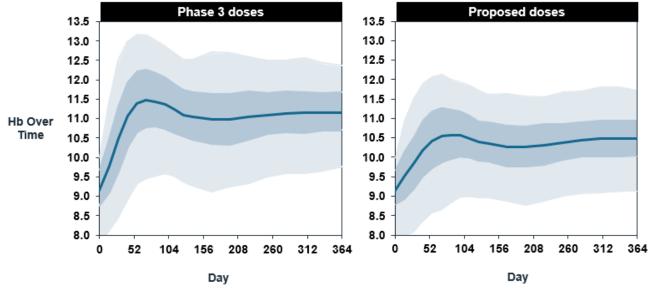

1.7.3. Starting Dose Reduction and Lowering Hb Target

Dosing recommendations for ESAs were modified in the post-marketing setting following evidence of an increased CV risk associated with higher Hb targets. Revised Hb targets were subsequently lowered, and Hb values > 11 g/dL are no longer a target for ESAs, though this has not been rigorously tested in randomized-controlled trials. In the roxadustat program, in both the NDD and DD studies, roxadustat-treated patients were treated to Hb targets of 10.5–12 g/dL. Similar to the strategy employed for ESAs, the Sponsor proposes to lower Hb targets in roxadustat-treated patients to 10–11 g/dL, which will lead to a lower effective dose and maintain the reduction in the risk of transfusion risk. In addition, like for ESAs, the Sponsor is recommending that the number of sequential dose increases in non-responsive patients is limited, to 3.

As noted in Section 1.6.3.1, rapid rise of Hb was more common in the first 12 weeks of treatment than in the later phases of the studies and was associated with a greater risk of thrombotic events. The Hb response in this early phase was mainly affected by the starting dose. As very few actual starting doses (non-randomized) were utilized in the Phase 3 program, the Sponsor conducted modeling and simulation to estimate the effect of a range of potential starting doses on Hb performance and rapid rise. A semi-mechanistic-pharmacodynamic longitudinal mixed-effect model previously used in Phase 3 planning was re-evaluated and re-estimated using the new Phase 3 data. The model describes the time-course of Hb changes after the administration of roxadustat and is represented schematically in Figure 72 in Section 11.

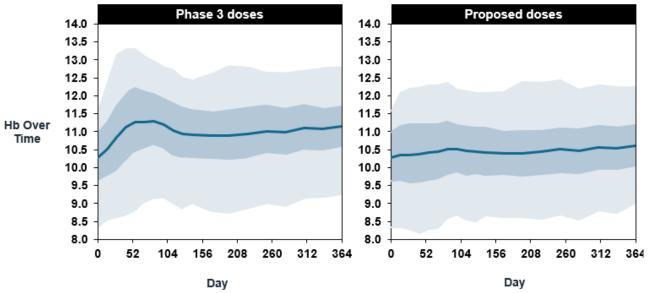

Figure 54 displays simulated Hb over time for ESA-untreated patients starting roxadustat, and Figure 55 for patients switching to roxadustat from ESA treatment. The graphs compare Hb dynamics with the doses utilized in the Phase 3 program and with the lower recommended starting doses. The reduced starting doses decrease the initial peak in Hb and rate of rise in both populations without diminishing longer-term efficacy.

Figure 54: Simulated Mean Hb Values with Roxadustat in Previously ESA-untreated Patients

Abbreviations: ESA=erythropoiesis-stimulating agent; Hb=hemoglobin. Note: Solid line is mean. Grey areas depict 5, 25, 75, 95% quantiles.

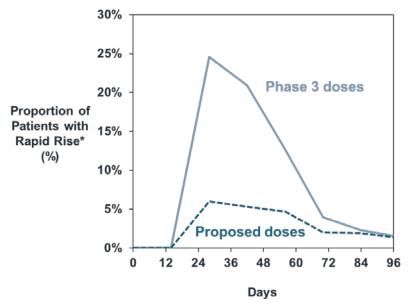

Figure 55: Simulated Mean Hb Values in Patients Converting from ESA to Roxadustat

Abbreviations: ESA=erythropoiesis-stimulating agent; Hb=hemoglobin. Note: Solid line is mean. Grey areas depict 5, 25, 75, 95% quantiles.

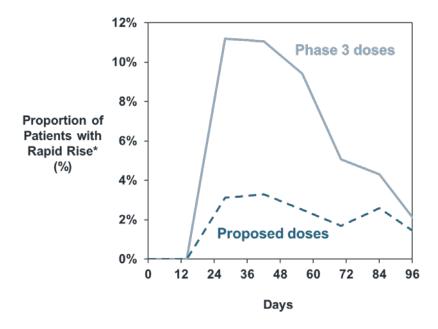

Figure 56 and Figure 57 display the incidence of rate of rise > 2 g/dL over 4 weeks for the ESA-untreated patients and ESA converters, respectively. The Phase 3 doses and the recommended lower starting doses are shown. The modeling and simulation data show reduction in the initial incidence of rapid rate of rise of Hb by at least two-thirds in both ESA-untreated and ESA conversion patients.

Figure 56: Proportion of Roxadustat Patients (Previously Untreated with ESA) with Rapid Rate of Hb Rise, Phase 3 Dose Compared to Proposed Dose

Abbreviations: ESA=erythropoiesis-stimulating agent; Hb=hemoglobin.

Figure 57: Proportion of Patients Converting from ESA to Roxadustat with Rapid Rate of Hb Rise, Phase 3 Doses Compared to Proposed Doses

Abbreviations: ESA=erythropoiesis-stimulating agent; Hb=hemoglobin.

The Sponsor plans reduced starting doses to mitigate the risk of VAT and other thrombotic complications and is evaluating potential post-marketing activities to assess Hb rate of rise and

^{*}Rapid rise: 4-week increase > 2 g/dL.

^{*}Rapid rise: 4-week increase > 2 g/dL.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

thrombosis risk with these changes. Additionally, the Sponsor recommends to lower Hb target in roxadustat-treated patients to 10–11 g/dL and to limit the number of successive dose increases in patients who are not responding to roxadustat. These changes are anticipated to reduce doses of roxadustat and improve the roxadustat safety profile, while retaining efficacy and the desired reduction in transfusion risk.

1.8. Benefit-Risk Summary

Roxadustat is a first-in-class, oral therapy that provides treatment of CKD anemia with the benefit of a novel mechanism of action that consistently corrects and maintains Hb across the spectrum of NDD and DD CKD anemia with an acceptable safety profile. In contrast to parenteral ESAs, which exogenously replace erythropoietin, roxadustat is a small molecule, reversible inhibitor of HIF-PH that stimulates HIF mediated erythropoiesis in a way that mimics the body's natural response to low oxygen environments by inducing endogenous erythropoietin and increasing iron availability.

The current paradigm and standard of care for anemia treatment in NDD CKD has limitations. By requiring frequent travel to a healthcare facility for many individuals, the standard of care over the last 30 years produces many barriers to effective anemia treatment. Standard treatment for NDD CKD anemia generally requires treatment in a healthcare setting every week to every 3 weeks, which is inconvenient and may preclude treatment for many patients. Due in part to these limitations, many patients are untreated, and rates of transfusions – which require substantial healthcare utilization, have significant risks, and can decrease access to kidney transplantation – are unacceptably high. Roxadustat offers patients with NDD CKD an oral, convenient, home therapy that provides a coordinated erythropoiesis involving both erythropoietin production and increased iron utilization, to benefit patients whose disease is sub-optimally managed in the current real-world setting.

Roxadustat provides benefit as it mitigates the IV iron requirement and lowers the risk of RBC transfusions. In the roxadustat clinical development program, all pivotal studies met the primary efficacy endpoint. The NDD trials demonstrated statistically significant treatment differences favoring roxadustat compared to placebo, providing patients with consistent increases in Hb regardless of baseline iron repletion status or inflammation. Importantly, patients treated with roxadustat achieved clinically meaningful reductions in transfusions. In the DD clinical trials, roxadustat was comparable in efficacy and safety to EPO.

Unlike ESAs, roxadustat achieved efficacy in patients with elevated hsCRP and those with normal hsCRP without a need for dose increase. In addition, roxadustat is an effective treatment for patients with markers of hyporesponsiveness to ESAs including increased ferritin and hepcidin. Outside of clinical trials, these patients are currently devoid of clinical options beyond higher doses of ESAs and additional IV iron or marked transfusion requirement. These individuals will benefit from a treatment with a different mechanism of action to raise their Hb levels.

Roxadustat demonstrated comparable CV safety to placebo in patients with NDD CKD and to EPO in patients with DD CKD. Patients treated with roxadustat had increased rates of VAT and DVT compared to EPO. Increased thrombosis risk was observed with higher rates of Hb rise in both roxadustat and EPO-treated patients, supporting the notion that reductions in the incidence of rapid rates of Hb rise can lower thrombosis risk in roxadustat-treated patients. More roxadustat-treated patients had seizures versus comparators, and patients with a history of seizure should be treated with roxadustat with caution. Increased fatal infection was noted for roxadustat compared with placebo in the NDD population; fatal infection risk, however, was not observed compared to darbepoetin. In

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

addition, this this finding was not duplicated in the DD population, where rates were generally similar between roxadustat and comparator. In order to improve roxadustat's safety profile while maintaining efficacy and reducing transfusion risk, the Sponsor proposes plans to use lower starting doses, to treat to lower Hb targets, and to limit the number of consecutive dose increases in patients not responding to roxadustat. The Sponsor will continuously evaluate, communicate, and mitigate known and potential risks associated with the use of roxadustat.

Overall, the roxadustat clinical program provided efficacy and safety data to support its use to increase and maintain Hb levels for patients across the continuum of CKD anemia. Roxadustat offers a novel mechanism of action for the treatment of CKD anemia with unique benefits compared to ESAs and the convenience of an oral treatment that can be used to support home hemodialysis, peritoneal dialysis, and non-dialysis patients. Based on the totality of the evidence, the benefit-risk is positive for roxadustat in patients with NDD and DD CKD who need correction of their anemia.

SUPPLEMENTAL INFORMATION

2. PRODUCT DESCRIPTION

2.1. Dosage

The roxadustat formulation is proposed in 5 dose strengths of 20, 40, 50, 70, and 100 mg tablets for oral administration. For ESA-naïve patients or those not currently receiving stable doses of ESA, the recommended starting dose of roxadustat is based on body weight. For patients converting from an ESA, the recommended starting dose of roxadustat is based on their prior ESA dose.

The dose range is 20 mg to 400 mg per administration.

Maximum Recommended Dose

- Patients not on dialysis: Not exceed a dose of 3 mg/kg or 300 mg TIW, whichever is lower
- Patients on dialysis: Not exceed a dose of 3 mg/kg or 400 mg TIW, whichever is lower

2.2. Product Overview

2.2.1. Pharmaceutical and Biological Properties of Roxadustat

Roxadustat is a new chemical entity and the first in a new pharmacologic class of small molecule therapeutics (Kang et al 2015). As shown in Figure 58, roxadustat is an N-acyl glycine resulting from the formal condensation of the amino group of glycine with the carboxy group of 4-hydroxy-1-methyl-7-phenoxyisoquinoline-3-carboxylic acid. The chemical classification/formula and other key characteristics of roxadustat are provided in Table 16.

Figure 58: Structural Formula of Roxadustat

Table 16: Key Characteristics of Roxadustat

International Non-proprietary Name/ Alternative Names	roxadustat (FG-4592)
Chemical Name	[(4-hydroxy-1-methyl-7-phenoxyisoquinoline-3-carbonyl) amino] acetic acid
Chemical formula	$C_{19}H_{16}N_2O_5$
Chemical Abstract Service Registry Number	808118-40-3
Molecular weight	352.34 g/mol
Class	Amide; antianemia; carboxylic acid; isoquinoline; small molecule
Mechanism of action	Binds to and potently inhibits HIF-PHD, reducing HIF breakdown and promoting its activity
Pharmacokinetics	Exposure increases dose-dependently (approximately proportional to dose) across 1–4 mg/kg dose range; half-life was 8–12 h
Pharmacodynamics	Dose-dependently increase Hb levels, reduce hepcidin and cholesterol levels and transiently increase endogenous EPO levels within or near physiologic range

2.3. Mechanism of Action

Roxadustat is a novel, orally bioavailable, potent and reversible HIF-PH inhibitor (HIF-PHI) that transiently induces HIF stabilization and leads to a functional HIF transcriptional response that mimics the erythropoietic response associated with exposure of humans to intermittent hypoxia. HIF induces expression of not only erythropoietin, but also the erythropoietin receptor and proteins that promote iron absorption and recycling from the macrophage iron storage system (Peyssonnaux et al 2008). Thus, roxadustat pharmacologically stimulates erythropoiesis via the HIF pathway and in a manner consistent with the physiologic response to hypoxia, but under normoxic conditions.

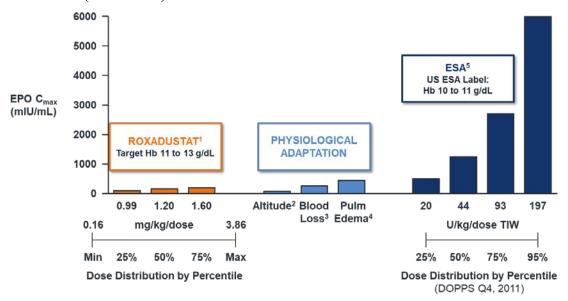

Roxadustat also has the potential to effectively treat anemia caused by inflammation-induced functional iron deficiency, which is typically hyporesponsive to ESAs. In these conditions, iron availability for erythropoiesis is reduced due to a number of inflammatory mediators. Because HIF-PHIs such as roxadustat alter expression not only of the erythropoietin gene, but also of genes regulating iron metabolism, it is postulated that roxadustat may be effective in treating these anemias as well (Siddiq et al 2005).

Chronic hypoxia and intermittent hypoxia induce different sets of genes associated with HIF transcriptional activity, presumably because intermittent stimulation allows the restoration of HIF degradation, turnover, and inactivation. Transient activation of HIF thereby precludes sustained gene expression and the induction of genes that are expressed late after HIF activation, as well as expression of additional genes that are secondary to activation of HIF-dependent genes. Both nonclinical and clinical studies of roxadustat have successfully used the intermittent dosing paradigm to induce selective erythropoiesis and to optimize the Hb dose response. Furthermore, roxadustat was selected for development over other HIF-PHI candidate molecules based on an optimal biodistribution profile that enhances its selective action (eg, kidney [erythropoietin production], bone marrow [increase in erythropoietin receptors], duodenum [iron transport], and liver [erythropoietin and transferrin production and down-regulation of hepcidin]).

The physiologic mechanisms underlying the effects of roxadustat on erythropoiesis are distinct from those of ESAs, and these differences result in several potential advantages over ESAs beyond the convenience of oral therapy.

- Increase in the number of erythropoietin receptors in the bone marrow
- Improved iron metabolism and bioavailability
- Effective erythropoiesis at levels comparable to physiologic plasma erythropoietin concentrations (~10 to 20-fold lower than the supra-physiologic levels associated with parenteral ESA therapy) (Figure 59)
- Effective erythropoiesis in the presence of inflammation
- Reduction in total and low-density lipoprotein (LDL) cholesterol

Figure 59: Circulating Erythropoietin Exposure with Roxadustat-Treated Patients with CKD and ESRD versus Reported ESA Dosing Patterns in ESRD (2005–2009)

Abbreviations: CKD=chronic kidney disease; C_{max} =maximal serum concentration; EPO=epoetin alfa; ESA=erythropoiesis-stimulating agent; ESRD=end-stage renal disease; Hb=hemoglobin; Max=maximum; Min=minimum; TIW=3 times per week.

¹C_{max} data for roxadustat estimated for a subset of 243 patients who achieved Hb response and were dosed at expected therapeutic doses; ²Milledge and Cotes 1985; ³Goldberg et al 1993, Maeda et al 1992; ⁴Kato et al 1994; ⁵Based on Flaharty et al. (1990).

3. REGULATORY AND DEVELOPMENT HISTORY

3.1. Regulatory Milestones

Key regulatory milestones between FDA and FibroGen in the clinical development of roxadustat are summarized in Table 17.

Table 17: Key Regulatory Milestones in Roxadustat Clinical Development

Dates	Discussion
04/17/2006	IND submitted under section 505 (b)(i) of the Food, Drug, and Cosmetic Act for roxadustat.
07/17/2012	End-of-Phase (EOP) 2 meeting: FDA requested that the roxadustat clinical development program be powered to assess CV safety for the NDD and DD CKD populations separately as a result of CV safety concerns for ESAs. To comply with this request, the sample size was increased in planned studies, new studies were added to the program, and study durations were extended. Independent CV endpoint adjudication was instituted, and FDA advised that while it would use MACE as its primary safety endpoint for analysis, the Sponsor could choose a different primary safety endpoint.
11/20/2012	FDA agreed that while placebo-controlled Phase 3 studies must be double-blind, open-label studies were acceptable for ESA comparator studies due to practical and ethical issues with a double-dummy design. FDA advised that open-label studies could contribute to the CV safety analysis since MACE is an objective endpoint that is not subject to ascertainment bias.
05/09/2014	FDA reiterated its preference for MACE as the primary safety endpoint. The choice of non-inferiority margin for the CV safety analysis was discussed, but no acceptable non-inferiority margin was agreed upon.
05/12/2014	Dosing regimens of once weekly, twice weekly, and TIW were initially investigated in the NDD Phase 3 program. At the May 2014 meeting, FDA recommended a single maintenance dosing regimen of TIW. Patients were converted to TIW dosing in Study 060 while patients were maintained on their original regimen in Study 608.
06/26/2017	FDA expressed concern that Study 1517-CL-0613 could be difficult to evaluate in pooled CV safety analysis as noted above and thus is not included in the DD pool.
07/30/2019	Pre-NDA meeting: The purpose of this meeting was to discuss the New Drug Application for roxadustat tablets for the treatment of anemia due to CKD. FDA advisement:
	The final Pooled Safety Analysis Plan safety pooling strategy in the NDD CKD population appears reasonable.
	The ITT analysis set for the MACE and MACE+ endpoints is preferred for analyses of the NDD CKD population.
	The final pooling strategy for analysis of CV safety (which removed Study 1517-CL-0613) in the DD CKD population appears reasonable.
	The OT+7 analysis set appears to be acceptable for analysis of the MACE and MACE+ endpoints in the DD CKD population, although sensitivity analyses should be done using the OT+28 analysis set.
12/20/2019	NDA submitted.

Abbreviations: CV=cardiovascular; DD=dialysis-dependent; ESA=erythropoiesis-stimulating agent; FDA=Food and Drug Administration; IND=investigational new drug; ITT=intent-to-treat analysis set; MACE=major adverse cardiac event (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalization for unstable angina or congestive heart failure NDA=New Drug Application; NDD=non-dialysis-dependent; OT+7=on-treatment plus 7 days; OT+28=on-treatment plus 28 days; TIW=3 times per week.

4. CLINICAL PHARMACOLOGY

4.1. Clinical Pharmacology Studies

The global clinical pharmacology program to characterize roxadustat pharmacokinetic (PK) and pharmacodynamic parameters related to erythropoiesis and absorption, distribution, metabolism, and elimination/excretion includes:

- 1. Nonclinical pharmacology studies including 19 in vitro and ex vivo studies using human biomaterials.
- 2. Clinical pharmacology studies including 26 studies in healthy subjects, 1 study in patients with hepatic impairment, 3 studies in patients with severe renal impairment or ESRD, as well as clinical Phase 2/3 studies in patients with NDD CKD or DD CKD.

A comprehensive summary of key clinical pharmacology findings is provided below.

4.2. Pharmacokinetics

4.2.1. General Pharmacokinetic Properties

The PK and metabolic profile of roxadustat was evaluated in healthy subjects and patients with severely impaired renal function (eGFR $< 30 \text{ mL/min/1.73 m}^2$), including patients with ESRD requiring hemodialysis or hemodiafiltration. Roxadustat plasma exposure (area under the curve [AUC] and maximum plasma concentration [C_{max}]) is dose-proportional from 20 to 280 mg (0.3 to 4.0 mg/kg, body weight); reaching a steady-state within one week with minimal accumulation. Roxadustat AUC is approximately 2-fold higher in patients with NDD or DD CKD than in healthy subjects, but C_{max} is comparable.

4.2.2. Absorption, Distribution, Metabolism, and Elimination

Absorption: Roxadustat is rapidly absorbed and bioavailable with C_{max} achieved at 2 h post-dose (fasted) in healthy subjects. Intake with food reduces the C_{max} by 25% but does not affect roxadustat bioavailability. In vivo studies in healthy human subjects have demonstrated that \geq 92% of the drug-related material in plasma is parent drug at 0.5 to 1 h post-dose from a single oral dose, suggesting that roxadustat is absorbed largely intact. In addition, recovery of Phase-1 oxidative and Phase-2 conjugated metabolites from urine and feces, accounting for 60% of the dose from a single oral dose is indicative of a high degree of absorption of roxadustat from the gastrointestinal tract.

<u>Distribution</u>: Roxadustat is highly bound (~99%) to human plasma proteins, predominantly to albumin. In patients with severe renal impairment and ESRD on hemodialysis or hemodiafiltration, the mean unbound % of roxadustat in plasma is slightly increased compared with healthy subjects (1.1 % vs 0.9%) Dialysis does not appear to influence the in vivo protein binding of roxadustat but higher levels of unbound roxadustat have been seen in patients with moderate hepatic impairment. The distribution of roxadustat into RBCs is low, with a blood-to-plasma ratio of 0.5 after single-dose administration of radiolabeled roxadustat.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

Metabolism: Roxadustat is metabolized by cytochrome P450 (CYP)2C8 and uridine diphosphate-glucuronosyltransferase (UGT)1A9. Roxadustat is primarily metabolized through 2 main metabolic pathways: hydroxylation/oxidation followed by sulfation, producing metabolites 4'-hydroxy roxadustat and 4'-O-sulfate conjugates of 4'-hydroxy roxadustat, together accounting for 20% of the radioactive dose. The O-glucuronidation produces metabolite 4-O- β -glucuronide of roxadustat, representing 28% of the dose. Minor metabolic routes included glucosidation producing 4-O- β -glucoside of roxadustat (8.1% of the dose), acyl glucuronidation producing acyl-1-O- β -glucuronide of roxadustat (0.6% of the dose), and demethylation producing N-descarboxymethyl roxadustat oxide and N-descarboxymethyl roxadustat (together ~3.6% of the dose).

<u>Elimination/Excretion</u>: The elimination and excretion of roxadustat and its metabolites involves multiple pathways including metabolism, biliary and/or intestinal clearance, and renal clearance (CLR). Roxadustat has an apparent total body clearance of 1.1 and 1.4 L/h in patients with NDD CKD and DD CKD respectively, compared with 2.3–2.6 L/h in healthy subjects. In feces, intact roxadustat was the major component (28%) of the dose, representing unabsorbed drug, biliary excretion of intact drug, and/or deconjugated (glucuronide) metabolites. The effective half-life of roxadustat is approximately 10 hours in healthy subjects, and 15 hours in patients with CKD.

4.2.3. Intrinsic Factors

Based on a population PK analysis of 2,855 subjects from 4 Phase 3 studies, no clinically relevant differences in the PK of roxadustat were observed based on age, sex, race, body weight, renal function (eGFR), or dialysis status in patients with anemia due to CKD.

<u>Hepatic impairment</u>: Following single-dose administration of 100 mg roxadustat in patients with moderate hepatic impairment (Child-Pugh Class B) and subjects with normal renal function, roxadustat AUC was increased by 23% and C_{max} decreased by 16% relative to healthy subjects matched for age, sex, and BMI. Roxadustat unbound fraction was increased in patients with moderate hepatic impairment (1.1% vs 0.8%), resulting in an increase in mean unbound C_{max} and AUC_{inf} of 16% and 70%, respectively, compared with matched healthy subjects. Roxadustat PK has not been studied in patients with severe hepatic impairment (Child-Pugh Class C). A lower starting dose is recommended when prescribing roxadustat to patients with moderate hepatic impairment.

Renal Impairment: A positive correlation was observed between roxadustat PK parameters (CL/F, CLR, and unbound CL/F and CLR) and renal function (eGFR). Most patients (\sim 70%) included in the analysis had an eGFR of \leq 15 mL/min/1.73 m².

4.2.4. Extrinsic Factors

4.2.4.1. In Vitro Findings

Roxadustat is a substrate of CYP2C8 and UGT1A9 enzymes, breast cancer resistance protein (BCRP), organic anion transporting polypeptide (OATP)1B1, and organic anion transporter (OAT)1 and OAT3. Roxadustat inhibits CYP2C8, BCRP, OATP1B1, and OAT3,

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

but showed no inhibition of other CYP metabolizing enzymes or transporters at clinically relevant concentrations, in vitro. Roxadustat does not induce CYP enzymes in vitro.

4.2.4.2. Effect of Other Drugs on Roxadustat

Metabolism- and transporter-based drug interactions were studied with gemfibrozil (CYP2C8 and OATP1B1 inhibitor) and probenecid (UGT and OAT inhibitor) in healthy subjects. Results from these studies were used to extrapolate findings to other concomitant medications or products sharing the same drug-drug interactions properties. In addition, population PK analysis of data obtained from Phase 3 clinical studies was used to characterize the impact of observed or anticipated interactions with phosphate binders, oral iron, clopidogrel and perpetrators of CYP2C8, UGT1A9, or OATP1B1 in the target population.

4.2.4.2.1. Phosphate Binders

Coadministration of phosphate binders and roxadustat decreased the absorption of roxadustat (excluding lanthanum carbonate hydrate). However, this effect can be mitigated by administering phosphate binders and roxadustat at least one hour apart.

4.2.4.2.2. Gemfibrozil

Coadministration of roxadustat with gemfibrozil (CYP2C8 and OATP1B1 inhibitor) in healthy subjects increased roxadustat AUC by 2.3-fold and C_{max} by 1.4-fold. The interaction between roxadustat and gemfibrozil or other inhibitors of CYP2C8 or OATP1B1 can be mitigated by regular monitoring of Hb levels in conjunction with dose adjustment according to roxadustat dose adjustment guidelines.

4.2.4.2.3. Probenecid

Coadministration of roxadustat with probenecid (UGT1A9, OAT1, and OAT3 inhibitor) increased roxadustat AUC by 2.3-fold and C_{max} by 1.4-fold and prolonged the half-life by 2.5 h. The interaction between roxadustat and probenecid or other inhibitors of OAT1, OAT3, or UGT1A9 or inducers of UGT1A9 can be mitigated by regular monitoring of Hb levels in conjunction with dose adjustment according to roxadustat dose adjustment guidelines. Probenecid is contraindicated for use in patients with severe renal impairment.

4.2.4.2.4. Other Drugs Without Clinically Meaningful Interactions

Roxadustat exposure was not affected by coadministration with oral iron (from population PK analysis only), clopidogrel (from population PK analysis only), Kremenzin[®], or lanthanum carbonate hydrate. Coadministration of omeprazole with roxadustat did not result in a clinically significant drug-drug interaction.

4.2.4.3. Effect of Roxadustat on Other Drugs

Coadministration of roxadustat with 3-hydroxy-3-methylglutaryl-coenzyme A reductase inhibitors (simvastatin, rosuvastatin and atorvastatin) increased plasma exposure of simvastatin, simvastatin acid (active metabolite of simvastatin). Time-separated administration of simvastatin and roxadustat did not reduce the interaction observed with simultaneous administration. These results indicate that roxadustat moderately inhibit BCRP

and OATP1B1. Based on the observed interaction, it is recommended that the maximum daily dose of statins should be reduced.

The PK exposure of bupropion, rosiglitazone, and S-warfarin (probe substrates for CYP2B6, CYP2C8 and CYP2C9, respectively) were not affected by coadministration with roxadustat.

4.3. Pharmacodynamics

4.3.1. Pharmacodynamic Markers of Biologic Activity

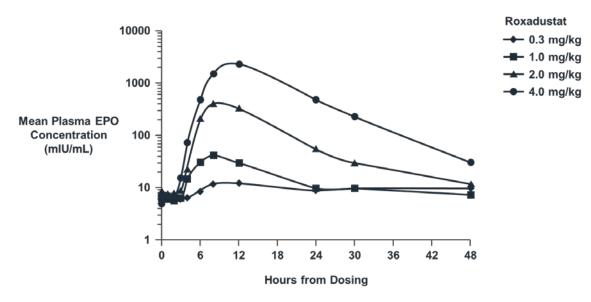

4.3.1.1. Hemoglobin

The purpose of roxadustat treatment was to raise and/or maintain Hb concentrations within the target range of 10 to 12 g/dL. Hb data from Phase 3 studies are the primary efficacy endpoints and are discussed in Section 5.

4.3.1.2. Erythropoietin

Data from the Phase 1 and Phase 2 studies have shown that single and repeated intermittent administration of roxadustat resulted in transient increases in EPO, which returned to baseline at approximately 48 h post-dose. Mean maximum EPO (EPO_{max}) levels increased more than proportionally with dose and were generally achieved approximately 8–12 h post-dose (Figure 60).

Figure 60: Plasma Endogenous EPO Concentration-Time Curve Profile in Healthy Subjects

Abbreviation: EPO=erythropoietin.

4.3.1.3. Hepcidin

Hepcidin, an iron metabolism regulating protein, is increased during inflammation and contributes to a lack of iron availability and therefore inadequate erythropoiesis. The principal mechanism of hepcidin is its inhibition of cellular iron efflux, blocking the effect of

Roxadustat
Cardiovascular and Renal Drugs Advisory Committee

FibroGen

the transport protein, ferroportin; under these conditions, macrophages, hepatocytes, and enterocytes retain iron (Atanasiu et al 2007; Ganz 2006). As iron is not released into the circulation, the availability to erythroid precursors is reduced. High hepcidin concentrations cause cellular iron overload, as occurs in hemochromatosis, and contribute to the typical pattern of chronic anemia referred as "functional iron deficiency." Roxadustat effects on hepcidin were studied in 6 Phase 1 studies and the Phase 2 and Phase 3 studies. Roxadustat was shown to cause a significant decrease in hepcidin levels from baseline in healthy subjects as well as patients with NDD CKD and DD CKD over a period of up to 24 weeks.

4.3.1.4. Serum Iron Markers

Roxadustat effects on iron utilization (iron status: serum iron, ferritin, TSAT, and soluble transferrin receptor) were studied in patients concomitantly treated with iron products in main Phase 3 studies. The data indicate that in patients with NDD CKD who did not receive ESA, levels of serum ferritin and TSAT initially decreased after the start of roxadustat treatment compared to placebo, then gradually increased to plateau around Week 20 and remained generally constant to Week 52. Serum iron levels decreased after the start of roxadustat treatment, then increased above the baseline in the roxadustat arm and were greater at each treatment visit compared with the placebo arm. Those data suggests that with a fall in hepcidin, ferritin is released from its sequestration. Iron is utilized during the period of anemia correction and then the stores rise (likely through the increased availability through intestinal absorption) during the period of maintenance. Similar findings were observed in patients with DD CKD.

4.3.2. Pharmacodynamic Markers of Safety

4.3.2.1. Heart Rate and Blood Pressure

Roxadustat treatment has been shown to produce a dose-dependent increase in heart rate in healthy subjects at doses greater than 2 mg/kg: a placebo-corrected heart rate increase of up to 9 to 10 beats per minute (bpm) at 8 to 12 h post-dose for the 2.75 mg/kg dose and 15 to 18 bpm at 6 to 12 h post-dose for the dose of 5 mg/kg. There was no clinically meaningful effect of roxadustat on blood pressure.

4.3.2.2. OT Intervals

A thorough QT study in healthy subjects was conducted using a therapeutic dose of 2.75 mg/kg (up to 280 mg) and a single supratherapeutic dose of 5 mg/kg (up to 510 mg) of roxadustat. There was no meaningful prolongation.

5. CLINICAL EFFICACY

5.1. Pivotal and Supportive Phase 3 NDD Studies

5.1.1. Study Design

The pivotal NDD studies were double-blind, placebo-controlled studies with a randomization scheme of 2:1 to roxadustat or placebo in Studies 060 and 608, and 1:1 in Study 001. The primary efficacy objective of these studies was to evaluate the efficacy of roxadustat in correcting anemia and maintaining Hb levels at 11 ± 1 g/dL for at least 52 weeks. The overall program was sized and was later extended up to 4 years to accumulate a sufficient number of adjudicated CV endpoints to evaluate CV safety.

In the pivotal NDD studies, given that the majority of patients with NDD CKD do not currently receive ESA treatment for their anemia, the studies were designed to use an oral placebo comparator in a double-blind study design to minimize bias and maintain clinical equipoise comparing the treatment of anemia with roxadustat to the lack of effective treatment for anemia which in essence patients with CKD (not requiring dialysis) are currently receiving. From a safety perspective, use of a placebo comparator is considered the gold standard to evaluate causality to treatment rather than comparing against an active comparator from a different drug class.

Key study design features are summarized in Table 18.

Table 18: Overview of Key Design Features of Pivotal and Supportive Phase 3
Studies in Patients with NDD CKD

Key design	Placebo-con	ESA-controlled Supportive Phase 3 NDD Study			
features	Study 608 Study 060 Study		Study 001	Study 610

Abbreviations: CKD=chronic kidney disease, eGFR=estimated glomerular filtration rate, ESA=erythropoiesis-stimulating agent; Hb=hemoglobin, NDD=non-dialysis-dependent.

[†]Treatment period was not split between correction and maintenance periods.

5.1.1.1. Efficacy Endpoints in Pivotal NDD Studies

5.1.1.1.1. Primary Efficacy Endpoint

The key primary efficacy endpoint for all 3 studies was the mean change in Hb (g/dL) from baseline to mean over Weeks 28 to 52 regardless of rescue therapy.

5.1.1.1.2. Selected Secondary Efficacy Endpoints

The secondary efficacy endpoints included:

- Proportion (%) of patients who achieved a Hb response at 2 consecutive visits during the first 24 weeks of treatment without rescue therapy (ie, RBC transfusion, ESA or IV iron)
 - A Hb response is defined as a Hb \geq 11.0 g/dL and a Hb increase from baseline by \geq 1.0 g/dL in patients with baseline Hb > 8.0 g/dL, or a Hb increase from baseline by \geq 2.0 g/dL in a patient with baseline Hb \leq 8.0 g/dL.
- Mean change from baseline in Hb to mean over Week 28 to 36 without rescue therapy within 6 weeks prior to and during this 8-week evaluation period
- Proportion (%) of patients with Hb level ≥ 10 g/dL averaged over Week 28 to 36 without use of rescue therapy within 6 weeks prior to and during these 8-week evaluation periods
- Mean change from baseline in Hb to mean over Week 28 to 52 regardless of rescue therapy in patients with baseline hsCRP>ULN
- Mean change from baseline in LDL cholesterol to mean over Week 12 to 28
- Time to (and % of patients who received) first rescue therapy (composite of blood/RBC transfusion, ESA use, and IV iron) over the first 52 weeks of treatment
- Time to first blood/RBC transfusion over the first 52 weeks of treatment

5.1.1.1.3. Exploratory Efficacy Endpoints

- Serum Hepcidin change from Baseline to Week 24 in patients with NDD CKD
- Serum Iron Markers: Assessment of mean serum iron, ferritin, and TSAT over time as indicators of iron status in patients with NDD CKD

5.1.1.2. Patient Eligibility Criteria in Pivotal NDD Studies

All eligible patients in the pivotal Phase 3 program were adult patients with CKD anemia. Patient eligibility for all studies specified a Hb threshold as an important inclusion criterion as well as threshold criteria for minimal iron stores. Patients with folate or B12 deficiencies and other known causes of anemia were excluded.

In the 3 pivotal NDD studies (Studies 060, 608 and 001), patients were to have CKD Stage 3–5, an eGFR < 60 mL/min/1.73 m² and Hb < 10.0 g/dL at baseline. Study 060 and 608 excluded patients with ESA use within 12 weeks prior to randomization; in Study 001, the exclusion period was 6 weeks.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

FibroGen

All patients were required to have an average baseline Hb \leq 10.0 g/dL based on the 2 or 3 most recent Hb values obtained during the screening period, except Study 610 which allowed an average Hb \leq 10.5 g/dL. Baseline ferritin was required to be \geq 30 ng/mL (for Studies 608 and 060), \geq 50 ng/mL (for Study 001) or \geq 100 ng/mL (Study 610). Patients could not have received any ESA treatment within 12 weeks (Studies 060 or 608) or 6 weeks (Study 001) in the global Phase 3 studies.

5.1.1.3. Statistical Analyses in Pivotal NDD Studies

5.1.1.3.1. Comparisons of Results from Individual Studies

The observed results and estimates of treatment effect (eg, mean Hb change from baseline on roxadustat and placebo), as well as CIs and p-values from the treatment comparison analyses for each study were presented side by side to demonstrate substantial evidence of effectiveness for each indication.

5.1.1.3.2. Pooled Analyses

The pooled analyses for the primary endpoint were performed on the ITT Population (which included all randomized patients). The rest of pooled analyses were performed on the Full Analysis Set (FAS) population (which included all randomized/enrolled patients who received at least one dose of study drug and had at least one post-dose Hb assessment). Overall analyses of dose safety were based on the Safety Analysis Set population (which included any randomized/enrolled patient with at least one dose of study drug). For the overall and subgroup analyses of the primary endpoint, the change from baseline Hb data from the multiple imputation (MI) datasets in each study were pooled and analyzed. The analysis model had terms for treatment, study, study*treatment interaction term and common randomization stratification factors as appropriate. Then, using the PROC MIANALYZE approach to summarize the results over the imputations. In the placebo-controlled global Phase 3 NDD CKD studies, the FDA primary efficacy endpoint of change from baseline in Hb to mean over Weeks 28 to 52 was evaluated using the MI Analysis of Covariance model (MI ANCOVA]), and superiority was established if p < 0.05 in Studies 060, 001, and 608. The pooled analysis methods for the same endpoints were analyzed following the same primary analysis method as specified in the individual study.

In general, the missing data handling for the analyses in the pooled dataset followed the same approach as for the primary analysis described for the individual studies. For example, the missing data for the change from baseline in Hb primary endpoint were imputed using the PROC MI procedure.

5.1.2. Demographic and Baseline Characteristics in Pivotal NDD Studies

Demographics and baseline characteristics in the ITT Population are provided in Table 19.

5.1.3. Efficacy Results in Pivotal NDD Studies

5.1.3.1. Primary Efficacy Endpoint Results

The primary efficacy endpoint results from the pooled NDD studies are shown in Table 20. Roxadustat treatment of patients with NDD CKD met the pre-specified primary efficacy endpoint with a statistically significant (p < 0.001) improvement in mean Hb levels regardless of rescue therapy in the pooled ITT Population compared to the placebo.

Table 20: NDD Studies: Mean Change in Hb from Baseline to Mean Over Weeks 28 to 52 Regardless of Rescue Therapy

5.1.3.2. Selected Secondary Efficacy Endpoint Results

5.1.3.2.1. Proportion of Patients Achieving Hb Response During the First 24 Weeks of Treatment Without Rescue Therapy

Table 21 shows the proportion of patients achieving a Hb response as defined in 5.1.1.1.2. In the pooled FAS population at the end of the 24-week treatment period, 80.2% of roxadustat-treated patients achieved a Hb response compared to 8.7% of placebo-treated patients; the difference in Hb response was statistically significant at p < 0.001.

5.1.3.2.2. Proportion of Patients with Hb \geq 10 g/dL Without Rescue Therapy

As shown in Table 22, a significantly higher proportion of patients from the roxadustat group (72.8%) achieved a mean Hb level of ≥ 10.0 g/dL averaged over weeks 28 to 36 compared to the placebo group (18.9%; p < 0.001).

^a 95% CI of response rate for each treatment group is based on the exact method of Clopper-Pearson.

^b Study 001 reported relative risk.

Note: Full analysis set.

5.1.3.2.3. Mean Change from Baseline in LDL Cholesterol

Patients treated with roxadustat had a 17% reduction in LDL cholesterol from baseline in the pooled NDD population compared to the placebo group (LSMean of the treatment difference [-19.8 mg/dL]) (p < 0.001) (Table 23).

^a the 95% CI of response rate for each treatment group is based on the exact method of Clopper-Pearson.

^b From Cochran-Mantel-Haenszel method adjusting for study, region (US, Europe, Other), baseline Hb (< 8 g/dL vs \geq 8 g/dL), baseline eGFR (< 30 vs \geq 30 mL/min/1.73 m²), and history of cardiovascular/ cerebrovascular/thromboembolic diseases (Yes vs No).

^{†:} in Study 001, this endpoint was defined as "proportion of total time of interpolated Hb (g/dL) values \geq 10 g/dL, from Weeks 28 to 52 analyzed by ANCOVA in the intent-to-treat set."

Table 23: NDD Studies: Mean Change from Baseline in LDL Cholesterol to Mean Over Weeks 12 to 28

Note: Full analysis set.

5.1.3.2.4. Proportion of Patients Receiving Any Rescue Therapy During the First **52** Weeks of Treatment

The proportion of patients who received any rescue therapy (RBC transfusion, ESA use, and IV iron) in the first 52 weeks of treatment was significantly lower in the roxadustat group (8.9%) than in the placebo group (31.1%; p < 0.001) (Table 24).

a: Baseline is defined as the last available value prior to the first dose of study treatment.

b: Treatment comparison was made using an ANCOVA model with baseline Hb, baseline eGFR, baseline LDL as covariates, and study, treatment, study-by-treatment interaction, history of cardiovascular/cerebrovascular/thromboembolic diseases (Yes vs No) and region (US, Europe, Other) as fixed effects.

^{†:} in Study 001, this endpoint was defined as mean change in LDL (mmol/L) from baseline to Week 24 analyzed by ANCOVA in ITT set.

^{‡:} No SE available.

Table 24: NDD Studies: Patients Receiving Rescue Therapy in the First 52 Weeks

Note: Full analysis set.

One additional study in patients with NDD CKD comparing roxadustat to darbepoetin alfa was performed (Study 610). While Study 610 cannot be pooled with the 3 placebocontrolled studies in NDD due to the different comparator arms, a description of the results can be found in Section 1.3.4.

5.2. Pivotal and Supportive Phase 3 DD Studies

5.2.1. Study Design

The pivotal DD studies were open label with EPO as comparator with a randomization scheme of 1:1 to roxadustat or EPO (Table 26). The primary efficacy objective of these studies was to evaluate the efficacy of roxadustat in correcting anemia and maintaining Hb levels at 11±1 g/dL for at least 52 weeks. For the pivotal DD studies, a single ESA, EPO, was selected as the comparator to allow the comparison to only one agent and given that it is the standard of care treatment for anemia in this patient population. Because of its use of 2

^{*:} In Study 608 and Study 060, this endpoint fell below an endpoint in the hierarchical testing order that did not reach statistical significance and thus was considered nominal.

a Rescue therapy: Any use of RBC.

b Patients with no event were censored at the date of minimum (last dose date, first dose date + 364 days, last visit date, death date).

c: From a stratified Cox Proportional hazards model adjusting for baseline Hb, baseline eGFR, and treatment, stratified by study, region (US, Europe, Other), and history of cardiovascular/cerebrovascular/thromboembolic diseases (Yes vs No).

d: Total PEY was calculated as minimum (364 days, last dose date - first dose date +1).

^{‡:} Endpoint was evaluated in the efficacy emergent period (date of first dose intake up to 7 days after the date of last dose or EOT visit, whichever occurs first) in Study 608.

^{†:} Endpoint was evaluated in the safety emergent period up to OT+28 in Study 001.

comparators (EPO and darbepoetin alfa), Study 613 is not able to be pooled with the other 3 studies and is presented as supportive of efficacy.

Table 26: Overview of Key Design Features of Pivotal and Supportive Phase 3 Studies in Patients with DD CKD

Hb Aim (g/dL) – Maintenance Period	10.0–12.0	10.0–12.0	10.0–12.0	10.0–12.0

Abbreviations: CKD=chronic kidney disease; DD=dialysis-dependent; ESA=erythropoieses-stimulating agent; ESRD=end-stage renal disease; Hb=hemoglobin; HD=hemodialysis; ID=incident dialysis; OL=open-label; SDD=stable dialysis-dependent; US=United States.

Note: Stable dialysis comprises the initiation of dialysis ≥ 4 months at the time of randomization. Incident dialysis comprises the initiation of dialysis ≥ 2 weeks but ≤ 4 months at the time of randomization.

5.2.1.1. Efficacy Endpoints in Pivotal Studies

5.2.1.1.1. Primary Efficacy Endpoint

The key primary efficacy endpoint for all global Phase 3 DD CKD studies was the mean change in Hb (g/dL) from baseline to mean over Weeks 28 to 52 regardless of rescue therapy.

5.2.1.1.2. Selected Secondary Efficacy Endpoints

The key secondary efficacy endpoints were:

- Mean change in Hb from baseline to mean over Week 28 to 36 without rescue therapy within 6 weeks prior to and during this 8-week evaluation period
- Proportion (%) of patients with Hb level averaged ≥ 10 g/dL over Week 28 to 36 without use of rescue therapy within 6 weeks prior to and during these 8-week evaluation periods

[†]≥ 8.5 g/dL for ID patients.

[‡]For patients not on ESA treatment.

Other secondary efficacy endpoints included:

- Hb change from baseline to the average in patients with DD CKD with baseline hsCRP > ULN between the pooled DD population and its constituent study populations.
- Mean LDL cholesterol changes from baseline to mean over Weeks 12 to 28
- Average monthly IV iron use over Weeks 28 to 52
- Proportion of patients who received RBC transfusion during treatment

5.2.1.1.3. Exploratory Efficacy Endpoints

- Serum Hepcidin change from Baseline to Week 24 in patients with DD CKD.
- Serum Iron Markers: Assessment of mean serum iron, ferritin, and TSAT over time as indicators of iron status in pooled FAS ID and SDD populations.

5.2.1.2. Patient Eligibility Criteria in Pivotal DD Studies

Adult male and female patients with CKD with anemia on hemodialysis or peritoneal dialysis with a Hb threshold as an inclusion criterion were eligible to participate. The ID and SDD populations were defined as patients who have been on dialysis for \leq 4 months or > 4 months, respectively, at the time of randomization. Studies 064 and 002 had mostly stable dialysis patients and some ID patients. Study 063 consisted of only ID patients that had to be on dialysis for \leq 4 months at the time of randomization. All patients in Study 063 were required to have an average baseline Hb < 10.0 g/dL. Study 063 excluded patients who had received more than 3 weeks of ESA treatment within 12 weeks prior to randomization. Study 064 required patients to have an average baseline Hb of 9.0–12.0 g/dL for stable dialysis patients and have been receiving IV or subcutaneous ESA (epoetin, darbepoetin, or methoxy polyethylene glycol-epoetin beta [Mircera®]) for \geq 8 weeks prior to randomization, whereas required baseline Hb \geq 8.5 g/dL for ID patients who have been on ESA for \geq 4 weeks prior to screening. Study 002 required patients with baseline Hb < 12 g/dL for patients treated with ESA previously and with baseline Hb < 10 g/dL for ESA-naïve patients.

5.2.1.3. Statistical Analyses in Pivotal DD Studies

The observed results and estimates of treatment effect (eg, mean Hb change from baseline on roxadustat and active control), as well as CIs from the treatment comparison analyses for each study were presented side by side to demonstrate substantial evidence of effectiveness. Similar as the pooled analyses performed in NDD population, the pooled analyses for the US primary endpoint in DD population were performed on the ITT Population. In the ESA-controlled global Phase 3 DD CKD studies, the FDA primary efficacy endpoint of change from baseline in Hb to mean over Weeks 28 to 52 was evaluated using MI ANCOVA with a non-inferiority margin of -0.75 g/dL. In general, the pooled analysis methods for the same endpoints were analyzed following the same primary analysis method as specified in the individual study. The missing data handling for the analyses in the pooled dataset followed the same approach for the primary analysis described for the individual studies.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

5.2.2. Demographic and Baseline Characteristics in Pivotal DD Studies

Demographics and baseline characteristics in the ITT Population are provided in Table 27.

Table 27: DD Studies: Demographic and Baseline Characteristics

Abbreviations: BMI=body mass index; DD=dialysis-dependent; ESA=erythropoiesis-stimulating agent; Hb=hemoglobin; hsCRP=high-sensitivity C-reactive protein; Max=maximum; Min=minimum; Roxa=roxadustat; SD=standard deviation; TSAT=transferrin saturation; ULN=upper limit of normal; US=United States of America.

^a: Hb, n (%) in the Study 002 and pooled DD population were categorized by $< 10 \text{ vs} \ge 10 \text{ g/dL}$.

b: History of cardiac, cerebrovascular, or thromboembolic disease, n (%), were combined in the pooled DD population.

c: ESA use at baseline in the pooled DD population is the Safety Analysis Set defined as randomized patients who took any dose of study medication Note: Intent-to-treat analysis set.

5.2.3. Efficacy Results in Pivotal DD Studies

5.2.3.1. Primary Efficacy Endpoint Results

The pre-specified primary endpoint was met in the pooled DD studies. The effect including the 95% CI of roxadustat was within the pre-specified non-inferiority margin (-0.75 g/dL), thereby demonstrating non inferiority compared to EPO on mean change from baseline in Hb over Weeks 28 to 52 regardless of rescue therapy (ie, RBC transfusion and ESA) (Table 28).

Table 28: DD Studies: Mean Change in Hb from Baseline to Mean Over Weeks 28 to 52 Regardless of Rescue Therapy

Abbreviations: CI=confidence interval; DD=dialysis-dependent; EPO=epoetin alfa; Hb=hemoglobin; LSMean=least squares mean; Max=maximum; Min=minimum; MMRM=mixed model of repeated measures; Roxa=roxadustat; SD=standard deviation; SE=standard error of the mean; US=United States.

Note: Hb values under the influence of a rescue therapy were censored up to 6 weeks in the analysis.

Note: Per Protocol Set

a: Baseline Hb is defined as the mean of up to 4 last central lab values prior to the first dose of study treatment.

b: In Study 063, treatment comparison was made using an MMRM with baseline Hb as covariate, and study, treatment, visit, visit-by-treatment interaction, study-by-treatment interaction, and history of cardiovascular/cerebrovascular/thromboembolic diseases (Yes vs No) as fixed effect.

c: In Study 064, treatment comparison was made using a n MMRM with baseline Hb as a covariate, and treatment, visit, visit-by-treatment interaction, ESA dependent incident dialysis within \leq 4 months vs > 4 months of starting dialysis when randomized, and randomization stratification factors except mean qualifying screening hemoglobin (\leq 10.5 vs > 10.5 g/dL) as fixed effects.

^d: In Study 002, the averages and difference in averages of the LSMeans from Weeks 28 to 36 with the corresponding CI were calculated from an MMRM with terms for the baseline Hb measurement as covariate and treatment group, visit and treatment by visit interaction, cardiovascular/cerebrovascular/thromboembolic history, geographical region (US versus Ex-US), and incident versus stable dialysis (\leq 4 versus > 4 months) as fixed effects. The unstructured covariance matrix was used to model the covariate structure.

e: Treatment comparison was made using an MMRM with baseline Hb as covariate and study, treatment, visit, visit-by-treatment interaction, study-by-treatment interaction, and history of cardiovascular/cerebrovascular/ thromboembolic diseases (Yes vs No) as fixed effects.

5.2.3.2.2. Hb Response with Roxadustat Compared to ESA in Patients with Inflammation at Baseline

Roxadustat demonstrated non-inferiority compared to ESA in increasing Hb levels in patients with DD CKD with evidence of inflammation at baseline (hsCRP > ULN) (Table 30). The analysis based on quintiles of hsCRP at baseline is presented in the Executive Summary of this document (Figure 18).

Table 30: DD Studies: Mean Change in Hb From Baseline to Mean Over Weeks 18 to 24 Regardless of Rescue Therapy in Patients with Baseline hsCRP > ULN

Note: Full analysis set.

5.2.3.2.4. Mean LDL Cholesterol Changes from Baseline to Mean Over Weeks 12 to 28

Treatment with roxadustat compared with the EPO was associated with a decrease in LDL cholesterol from baseline to the average over Weeks 12 to 28 (-17.2 mg/dL versus -1.4 mg/dL) (Table 32).

^a: Monthly iron use for each patient=Total IV iron in mg/ ([last visit date - first dose date of study medication in the period+1]/28).

b: p-value is based on Koch et al (1982, 1990) stratified rank ANCOVA analysis, which was stratified by iron repletion status and randomization stratification factors except mean qualifying screening hemoglobin (≤ 8.0 g/dL versus

status and randomization stratification factors except mean qualifying screening nemoglobin (\leq 8.0 g/dL) and considering baseline hemoglobin as covariates for the comparison between roxadustat and epoetin alfa.

c: p-value is based on Koch et al. (1982, 1990) stratified rank ANCOVA analysis, which was stratified by iron repletion status and randomization stratification factors except mean qualifying screening hemoglobin ($\leq 10.5 \text{ vs} > 10.5 \text{ g/dL}$) and considering baseline Hb as covariates for the comparison between roxadustat and epoetin alfa.

d: p-value is from Wilcoxon Rank-Sum Test.

^{#:} În Study 002, IV iron data were collected from Week 36 to EOS in the ITT Population.

^{*:.} The max in the pooled analysis was calculated as the weighted average IV iron use during Weeks 28–36 and Weeks 37–52.

Table 32: DD Studies: Mean Change in LDL Cholesterol from Baseline to Mean Over Weeks 12 to 28

5.2.3.2.6. Primary Efficacy Endpoint Results in Patients with ID-DD CKD

The mean change from baseline in Hb averaged over Weeks 28 to 52 regardless of rescue therapy was non-inferior in the roxadustat group compared to the EPO group (Table 34).

^a Any use of RBC transfusion.

^b Patients with no event were censored at the date of minimum (last dose date, last visit date, death date).

^c From a stratified Cox Proportional hazards model adjusting for treatment stratified by study, baseline Hb ($< 10 \text{ g/dL vs} \ge 10 \text{ g/dL}$) and history of cardiovascular/cerebrovascular/thromboembolic diseases (Yes vs No).

Note: In Study 002, patients who did not experience RBC transfusions were censored at the earliest occurrence of either 3 days after their last intake of study drug, or the date of withdrawal of consent or last study contact if the patient withdrew consent or was lost to follow-up, or at the date of death.

6. CLINICAL SAFETY

6.1. Overview of Safety Evaluation Plan

The pooled safety analysis population consisted of all randomized patients who received at least one dose of study drug in 3 pooled NDD studies (Studies 001, 060, and 608), and 3 pooled DD studies (002, 063, and 064), consisting of 4,326 patients treated with roxadustat, 1,884 patients treated with placebo and 1940 patients treated with EPO. CV safety was examined using events that were adjudicated by an independent committee blinded to treatment assignment.

In addition, supportive data from Study 610 (consisting of 323 patients treated with roxadustat and 293 patients treated with EPO) are presented due to that study's unique design as an active-controlled NDD trial which was not affected by bias due to different study drug discontinuation. Data from Study 613 (Study 613, consisting of 414 patients treated with roxadustat, 257 patients treated with EPO, and 163 patients treated with darbepoetin alfa) were excluded from the pooled DD CKD analyses because this study included 2 comparators (EPO and darbepoetin alfa), different from other 3 DD studies with a single active comparator (EPO).

6.2. Safety Data/Endpoints (NDD and DD)

Safety data collection included AEs, SAEs, discontinuation of study medication due to AEs, and other standard safety measures (eg, laboratory values, vital signs, electrocardiogram, etc). All reported AEs for the pivotal studies were collected while patients remained on treatment up to 28 days, and those events occurring within this OT+28-day period were considered treatment-emergent. The approach to safety data collection following the OT+28-day period varied among the pivotal trials. In Study 608, patients that discontinued treatment prematurely were assessed every 6 months until the end of the study for vital status, SAEs, and CV and thromboembolic events, unless consent was withdrawn; Studies 063, 064, and 060 conducted telephone visits every 3–6 months to assess for CV events; and Studies 001 and 002 favored continued study visits with no change to safety data collection, but allowed for modified follow-up such as telephone visits, when necessary to avoid withdrawal of consent.

The key CV safety endpoints were as follows:

- MACE: consisting of adjudicated events of myocardial infarction, stroke, and ACM
- MACE +: MACE plus additional adjudicated events of hospitalized unstable angina and hospitalized congestive heart failure
- ACM: all-cause mortality

6.3. Clinical Safety–Overall Extent of Exposure (NDD and DD)

A total of 9,600 patients with CKD anemia were exposed to the study drugs (roxadustat, placebo, EPO) in the Phase 3 studies as shown in Table 35.

Table 35: Total Exposure to Study Drugs in Phase 3 Studies

Note: Safety Population; On-study analysis, NDD Pool: Studies 001, 060,608, hazard ratio upper bound of 95% CI below reference margin of 1.3.

Figure 62: Pooled NDD Studies: Kaplan-Meier Curves of Primary Analysis of ACM

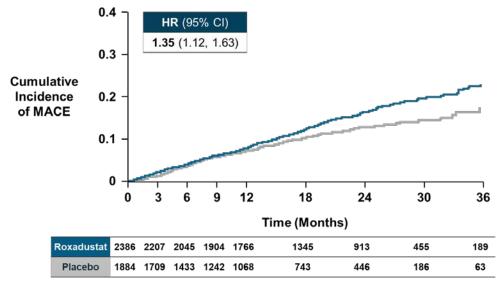

Abbreviations: ACM=all-cause mortality; CI=confidence interval; NDD=non-dialysis-dependent Note: Safety Population; On-study analysis, NDD Pool: Studies 001, 060,608, hazard ratio upper bound of 95% CI below reference margin of 1.3.

On-treatment Analysis of MACE in the NDD pool

Figure 63 shows the Kaplan-Meier curve for MACE in the NDD pool in the OT+28 days analysis set. The curves track closely together until 9–12 months following randomization and then separate due to decreasing event rates in the placebo group, consistent with observed differences in rates of MACE being due to informative censoring in the placebo group.

Figure 63: Pooled NDD Studies: MACE Results in the OT+28 Analysis Set

Abbreviations: CI=confidence interval; HR=hazard ratio; MACE=major adverse cardiovascular events (all-cause mortality, myocardial infarction, and stroke); OT+28=on-treatment plus 28 days.

MACE+	283 (25.9)	269 (24.6)	1.04 (0.88, 1.24)
ACM	201 (18.4)	187 (17.1)	1.05 (0.86, 1.28)

Abbreviations: ACM=all-cause mortality; CI=confidence interval; eGFR=estimated glomerular filtration rate; HR=hazard ratio; MACE=major adverse cardiovascular events (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalization for unstable angina or congestive heart failure; NDD=non-dialysis-dependent. Note: Safety Population; On-study analysis.

6.4.1.1. Placebo Evaluation Period Adjusted Analysis

Due to the differential discontinuation rates between the roxadustat and placebo groups in the pooled NDD population that result in informative censoring which biases event rate comparison in on-treatment analyses, a more appropriate comparison is to disregard the treatment-emergent window and allow comparisons to be based on equal follow-up time. One method, the placebo evaluation period adjusted method, adjusts the follow-up time in patients on placebo who were censored at OT+28 to be comparable to the expected time at risk accrued through OT+28 in patients on roxadustat with the same baseline characteristics that were associated with the risk of major clinical events.

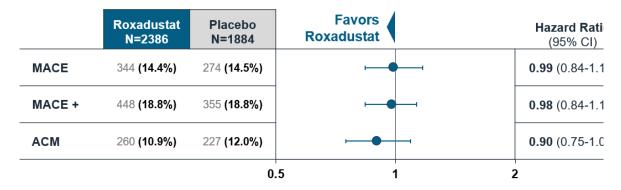

The observed OT+28 window of placebo patients is replaced by a randomly selected OT+28 window from a donor pool of roxadustat patients with similar baseline characteristics. This process is repeated 1000 times. The final estimate of HR and its 95% CI are obtained from the MI (MIANALYZE) procedure.

Note that only the event evaluation periods of the placebo patients are adjusted. Additional events that occurred in the placebo patients that were originally not included may now be

included in the analysis only because of the lengthening of the evaluation period. There is no imputation on the occurrence of the events.

Figure 64 shows results using the placebo evaluation period adjusted method for MACE, MACE+, and ACM. HR point estimates range from 0.90–0.99, with 95% CIs which cross 1.0 with upper bounds of 1.09–1.17.

Figure 64: Pooled NDD Studies: Forest Plot of Analyses of MACE, MACE+, and ACM Using the Placebo Evaluation Period Adjusted Method

Abbreviations: ACM=all-cause mortality; CI=confidence interval; eGFR=estimated glomerular filtration rate; HR=hazard ratio; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalization for unstable angina or congestive heart failure; NDD=non-dialysis-dependent. Note: HR is estimated using the Cox regression model by study in each sampling replicate. The Cox model includes cardiovascular/cerebrovascular/thromboembolic medical history (yes vs no), geographical region (Europe vs ex-Europe), baseline hemoglobin ($< 8 \text{ g/dL vs} \ge 8 \text{ g/dL}$) and baseline eGFR ($< 10 \text{ mL/min/1.73 m}^2 \text{ vs} \ge 10 \text{ mL/min/1.73 m}^2$) as strata. The final HR and the 95% CI are estimated using MIANALYZE.

6.4.1.2. All-Cause Mortality in Pivotal Phase 3 NDD Studies: Cause of Death

The rates of all-cause deaths were comparable in the roxadustat group and the placebo group. Adjudicated causes of death are presented in Table 39.

Table 39: Pooled NDD Pooled: All-Cause Mortality

HR (95% CI)	1.02 (0.8	1.02 (0.88, 1.20)		30, 1.05)	1.02 (0.84, 1.23)		

Abbreviations: ACM=all-cause mortality; CI=confidence interval; DD=dialysis-dependent; EPO=epoetin alfa; IR=incidence rate; HR=hazard ratio; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalization for unstable angina or congestive heart failure; OT+7=on-treatment plus 7 days; PY=patient years.

Note: Safety Population, OT+7 analyses, DD Pool: Studies 002, 063, 064

The Kaplan-Meier survival analysis plots for the endpoints of MACE show the probability of remaining event-free over time (Figure 44). Survival curves of the 2 treatment groups tracking closely together in all 3 endpoints are supportive of the comparable risks of MACE, MACE+ (Figure 65) and ACM (Figure 66) between roxadustat and placebo.

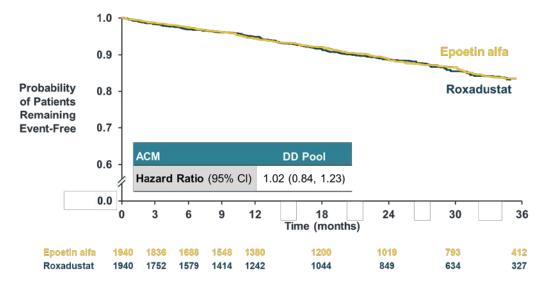

Figure 65: Pooled DD Studies: Kaplan-Meier Survival Curves of MACE+

Abbreviations: CI=confidence interval; DD=dialysis-dependent; EPO=epoetin alfa; FAIR=Follow-up adjusted incidence rate; MACE+=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke) plus hospitalizations for unstable angina or congestive heart failure; OT+7=on-treatment plus 7 days.

Figure 66: Pooled DD Studies: Kaplan-Meier Curves of Primary Analysis of ACM

Abbreviations: ACM=all-cause mortality; CI=confidence interval; DD=dialysis-dependent; OT+7=on-treatment plus 7 days.

Note: Safety Population, OT+7 analyses, DD Pool: Studies 002, 063, 064.

In agreement with FDA, on-treatment plus 7 days (OT+7) was chosen as the primary analysis set for CV safety in the DD population. This analysis was chosen to allow for the capture of residual safety events, while minimizing confounding due to Hb fluctuation and/or ESA treatment following roxadustat discontinuation. OT+28 was agreed to as a supportive analysis, and the HR (95% CI) for MACE was 1.08 (0.94, 1.25) (Figure 67).

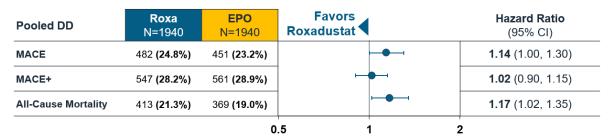

Figure 67: Pooled DD Studies: Forest Plot of MACE, MACE+, and ACM (OT+28)

DD Pool	Roxadustat N = 1940	Epoetin Alfa N = 1940	Favors Roxadustat	Hazard Ratio (95% CI)
MACE	370 (19.1%)	388 (20.0%)	—	1.08 (0.94, 1.25)
MACE+	437 (22.5%)	504 (26.0%)	<u> </u>	0.97 (0.85, 1.10)

Roxa=roxadustat. Note: Safety Population, OT+28 Analysis, DD Pool: Studies 002, 063, 064.

On-study results for the DD population are presented below (Figure 68). One concern with the use of on-study analyses in this patient population is that these analyses will reflect the period of Hb adjustment when roxadustat patients who discontinued study treatment had to be titrated to standard of care ESA treatment, or alternatively a period of no anemia treatment which would be expected to lead to a reduction in Hb. No such titration period was required for EPO-treated patients who discontinued study treatment as they would be expected to continue on ESA (Figure 70). Consequently, the ITT analysis of the DD population is biased away from the null and against roxadustat compared to ESA. Notably, on-study results in the ID subgroup revealed HR point estimates of 0.87–1.01 (Figure 69).

Figure 68: Pooled DD Studies: Forest Plot of MACE, MACE+, and ACM (On-Study)

6.5. General Safety Assessment of Roxadustat in NDD Population

6.5.1. Exposure in Pivotal NDD Studies

The large safety population of the NDD pool (n=4,270) from 3 pivotal Phase 3 studies includes 2,386 patients treated with roxadustat and 1,884 patients on placebo. No patients were on dialysis at the time of randomization, but ~ 35% of patients were initiated on dialysis during the study period. As shown in Table 43, mean duration of exposure and PY were greater in the roxadustat treatment group than in the placebo group due to the earlier and greater rates of study drug discontinuations in the placebo group resulting in a more pronounced difference in overall exposure to study treatment between the treatment groups.

Patient disposition and baseline demographics and other characteristics, including CV history, were generally similar for the treatment groups in the NDD pool.

Table 43: Pooled NDD Studies: Overall Drug Exposure (Safety Population)

	Roxadustat (N=2386)	Placebo (N=1884)
Patient Exposure (Week):		
Mean (SD)	84.6 (48.79)	64.3 (44.82)
Median (Min-Max)	87.1 (0 –234.9)	57.1 (0 –208.1)
Mean Exposure (Year)	1.6	1.2
Total PY	3870.7	2323.2

Abbreviations: NDD=non-dialysis-dependent; PY=patient year; SD=standard deviation.

Note: Safety Population, NDD Pool: Studies 001, 060, 608.

6.5.2. Safety Data from Pivotal NDD Studies

To account for differences in study drug exposure per treatment group in the NDD population, exposure-adjusted incidence rates are presented in addition to incidence. However, this does not account for overrepresentation of higher-risk patients in the roxadustat group for on-treatment analyses.

An overview of AEs in the pooled NDD studies is provided in Table 44. Most patients experienced at least 1 AE in both groups. Roxadustat-treated patients had slightly higher incidence rates of SAEs. Roxadustat-treated patients had higher incidence rate of fatal events during the treatment emergent period; however, ACM, which includes deaths both on treatment as well as during long-term follow-up period, was similar for both groups: 8.3 deaths per 100 PY for roxadustat and 8.1 deaths per 100 PY for placebo.

The incidence rate for AEs that led to discontinuation was similar for roxadustat and placebo (3.9 vs 3.8 per 100 PY).

Table 44: Pooled NDD Studies: Summary of Overall Treatment-Emergent Adverse Events in Roxadustat and Placebo Groups

^a All-cause deaths occurred during both on-treatment and long-term follow-up period (ITT analysis). Each death was adjudicated by a central adjudication committee that was blinded to treatment assignment. Note: Safety Population, OT+28 analyses, NDD pool: Studies 001, 060, 608.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

6.5.2.1. Common Treatment-Emergent Adverse Events

Treatment-emergent AEs reported in \geq 5% of patients in either group are presented in Table 45. The most commonly reported AEs in both roxadustat and placebo-treated patients were ESRD, hypertension, and peripheral edema. Other common events were mostly gastrointestinal events (ie, diarrhea, nausea, constipation, and vomiting), infections (urinary tract infection, upper respiratory infections, and pneumonia) and laboratory abnormalities (hyperkalemia and hypoglycemia). AEs with an incidence rate of > 1.0 patients per 100 PY in roxadustat versus placebo patients included hypertension, peripheral edema, hyperkalemia, diarrhea, urinary tract infection, nausea, constipation, and insomnia.

6.5.2.2. Treatment-Emergent Adverse Events Leading to Discontinuation

The summary of AEs that led to treatment discontinuation is presented in Table 46. The overall incidence of AEs leading to discontinuation was comparable and low in both treatment groups. No single event leading to study discontinuation in any treatment group was reported in > 1% of patients.

Table 46: Pooled NDD Studies: Summary of Treatment-Emergent Adverse Events (≥ 0.3%) Leading to Discontinuation by Preferred Terms in Roxadustat and Placebo Groups

		dustat 2386	Placebo N=1884

6.6. General Safety Assessment of Roxadustat in DD Population

6.6.1. Exposure in Pivotal DD Studies

The pooled pivotal Phase 3 studies in patients with DD CKD include 1940 roxadustat-treated patients and 1940 EPO-treated patients. The exposure to treatment was shorter for the roxadustat group compared to EPO- (Table 47). The ID-DD subpopulation included 760 roxadustat-treated patients and 766 EPO-treated patients.

Table 47: Pooled DD Studies (ID-DD and SDD-DD Subpopulations): Overall Drug Exposure

	Poole	d DD Pool		ed ID	Pooled SDD	
	Roxadustat (N=1940)	Epoetin Alfa (N=1940)	Roxadustat (N=760)	Epoetin Alfa (N=766)	Roxadustat (N=1180)	Epoetin Alfa (N=1174)
Patient Exposure (Week):						
Mean (SD)	89.2 (58.69)	100.7 (57.54)	75.4 (57.62)	81.0 (60.29)	98.0 (57.68)	113.5 (51.82)
Median (Min-Max)	87.9 (0.1–227.9)	107.5 (0.1–226.9)	54.6 (0.4–227.9)	59.9 (0.1–226.9)	106.9 (0.1–195.7)	135.6 (0.4–195.4)
Mean Exposure (Year)	1.7	1.9	1.4	1.6	1.9	2.2

Abbreviations: DD=dialysis-dependent; ID=incident dialysis; Min=minimum; Max=maximum; SDD=stable dialysis-dependent; SD=standard deviation.

Note: Safety Population, DD Pool: Studies 002, 063, 064.

6.6.2. Safety Data from Pivotal DD Studies

An overview of AEs in the pooled DD studies is provided in Table 48. Similar to the NDD studies, most patients in the DD studies also experienced at least 1 AE. The percentage of patients experiencing at least one AE was similar in both groups. Roxadustat- and EPO-treated patients had similar rates of SAEs and fatal events. More patients in the roxadustat group experienced AEs leading to discontinuation.

Table 48: Pooled DD Studies: Summary of Overall Treatment-Emergent Adverse Events in Roxadustat- and Epoetin Alfa Groups

	Roxadustat N=1940	Epoetin Alfa N=1940

Abbreviations: AE=adverse event; DD=dialysis-dependent; N=number of patients within treatment group; n=number of patients with the specified event; OT+7=on-treatment plus 7 days; OT+28=on-treatment plus 28 days; SAE=serious adverse event.

Note: Safety Population, OT+28 analyses, DD Pool: Studies 002, 063, 064.

6.6.2.1. Common Treatment-Emergent Adverse Events

The AE profile was generally similar for patients receiving roxadustat compared with those receiving the EPO. The summary of AEs with $\geq 5\%$ incidence is tabulated in Table 49. The most common AEs in both treatment groups were hypertension and diarrhea (both > 10%). Among other common events were headache, complications associated with vascular access, gastrointestinal events and infections.

^a Data shown from OT+7 analyses. Each death was adjudicated by a central adjudication committee that was blinded to treatment assignment.

Fall	88 (4.5)	101 (5.2)
Atrial fibrillation	59 (3.0)	107 (5.5)

Abbreviations: AE=adverse event; DD=dialysis-dependent; OT+28=on-treatment plus 28 days. Note: Incidence ≥ 5%, Safety Population, OT+28 analyses, DD Pool: Studies 002, 063, 064.

6.6.2.2. Treatment-Emergent Adverse Events Leading to Discontinuation

As shown in Table 50, the incidence of AEs leading to discontinuation of treatment was 11.2% in roxadustat group and 8.2% in the EPO group. Cardiac arrest was the only single event reported in $\geq 1\%$ of patients leading to study discontinuation in both treatment groups.

Table 50: Pooled DD Studies: Summary of Treatment-Emergent Adverse Events (≥ 0.3%) Leading to Discontinuation by Preferred Terms in Roxadustatand Epoetin Alfa Groups

	Roxadustat N=1940	Epoetin Alfa N=1940
Preferred Term	n (%)	n (%)
AEs leading to discontinuation	218 (11.2)	159 (8.2)
Cardiac arrest	19 (1.0)	25 (1.3)
Sepsis	11 (0.6)	4 (0.2)
Septic shock	12 (0.6)	4 (0.2)
Acute myocardial infarction	10 (0.5)	6 (0.3)
Cardio-respiratory arrest	10 (0.5)	7 (0.4)
Nausea	8 (0.4)	0
Death	6 (0.3)	12 (0.6)

Myocardial Infarction	5 (0.3)	3 (0.2)
Multiple organ dysfunction syndrome	5 (0.3)	3 (0.2)
Sudden death	5 (0.3)	3 (0.2)
Hemorrhagic stroke	3 (0.2)	5 (0.3)

Abbreviations: AE=adverse event; DD=dialysis-dependent; OT+28=on-treatment plus 28 days. Note: Safety Population, OT+28 analyses, DD Pool: Studies 002, 063, 064.

7. DATA FROM SUPPORTIVE STUDY 610

7.1. General Safety Data from Supportive Study 610

The overall incidence of AEs observed in this study was comparable between treatment groups; 91.6% of patients in the roxadustat group and 92.5% of patients in the darbepoetin alfa group experienced AEs (Table 51). The incidence of SAEs was 64.7% in the roxadustat group versus 61.8% in the darbepoetin group; the incidence of AEs leading to death was 10.5% versus 11.6%, respectively. The percentage of patients with AEs leading to discontinuation was 7.7% in the roxadustat group compared to 3.8% in the darbepoetin group.

Table 51: Study 610: Overview of Treatment-emergent Adverse Events and Death (Safety Analysis Set)

	Roxadustat №323	Darbepoetin alfa N=293
Adverse Event	296 (91.6%)	271 (92.5%)
Serious Adverse Event	209 (64.7%)	181 (61.8%)
Adverse Event Leading to Death	34 (10.5%)	34 (11.6%)
Adverse Event Leading to Withdrawal of Treatment	25 (7.7%)	11 (3.8%)

The most common AEs were ESRD (33.4% in the roxadustat group vs 36.2% in the darbepoetin group), hypertension (29.7% vs 33.8%), decreased glomerular filtration rate (17.0% vs 16.7%), edema peripheral (15.2% vs 12.3%), and hyperkalemia (11.8% vs 14.3%) (Table 52).

Table 52: Study 610: Treatment-Emergent Serious Adverse Events (Safety Analysis Set)

	Roxadustat N=323	Darbepoetin alfa N=293
D 617	n (%)	n (%)
Preferred Term		
End-stage renal disease	108 (33.4)	106 (36.2)
Hypertension	96 (29.7)	99 (33.8)
Glomerular filtration rate decreased	55 (17.0)	49 (16.7)
Oedema peripheral	49 (15.2)	36 (12.3)
Hyperkalemia	38 (11.8)	42 (14.3)
Nausea	35 (10.8)	25 (8.5)
Viral upper respiratory tract infection	29 (9.0)	25 (8.5)
Diarrhea	28 (8.7)	30 (10.2)
Hyperphosphatemia	28 (8.7)	15 (5.1)
Pneumonia	25 (7.7)	22 (7.3)
Muscle spasms	25 (7.7)	15 (5.1)
Dyspnea	24 (7.4)	12 (4.1)
Bronchitis	22 (6.8)	18 (6.1)
Constipation	21 (6.5)	15 (5.1)
Vomiting	21 (6.5)	19 (6.5)
Urinary tract infection	21 (6.5)	27 (9.2)
Iron deficiency	21 (6.5)	25 (8.5)
Headache	21 (6.5)	12 (4.1)
Back pain	20 (6.2)	17 (5.8)
Pruritus	20 (6.2)	13 (4.4)
Insomnia	19 (5.9)	8 (2.7)
Anemia	14 (4.3)	19 (6.5)
Atrial fibrillation	18 (5.6)	12 (4.1)
Cardiac failure	18 (5.6)	18 (6.1)
Arthralgia	18 (5.6)	14 (4.8)
Dizziness	16 (5.0)	15 (5.1)

Abbreviations: N=number of patients in treatment group; n=number of patients with specified adverse event. Note: incidence \geq 5% in either group.

The overall incidence of AEs leading to treatment discontinuation was higher in roxadustattreated patients: 7.7% in the roxadustat group vs 3.8% in the darbepoetin group. ESRD was

the only AE leading to discontinuation that occurred in more than 1 patient in the roxadustat group (3 [0.9%] vs 2 [0.7%] patients in the darbepoetin group).

7.2. Safety Assessment of Specific Adverse Events from Supportive Study 610

Some imbalances in specific AEs were noted during the review of safety data from the NDD and DD pools. Table 53 presents a summary of those AEs for Study 610. VAT events were uncommon in Study 610, and the incidence of DVT and PE AEs was low in both groups. The incidence of infection AEs and SAEs were numerically lower and higher, respectively, for roxadustat compared to darbepoetin alfa; 2.2% of roxadustat patients died from infection, compared to 3.1% of darbepoetin patients. The event rate per 100 PY of convulsion AEs was 1.1 in the roxadustat group and 0.2 in the darbepoetin alfa group.

Table 53: Study 610: Summary of Specific Adverse Events

	Roxadustat	Darbepoetin Alfa

Abbreviations: MedDRA=Medical Dictionary for Regulatory Activities: N=number of patients in treatment group; n=number of patients with specified adverse event; SMQ=standardized MedDRA query; SOC=System Organ Class.

8. DATA FROM SUPPORTIVE STUDY 613

8.1. Efficacy Data from Supportive Study 613

A total of 838 patients were randomized into the study. All data from site 70051 (2 randomized patients) are excluded due to Good Clinical Practice violations. Therefore, a total of 836 patients were considered as ITT for statistical analysis, 415 to the roxadustat treatment group and 421 to the ESA group. Of these patients, a total of 834 patients (414 roxadustat, 420 ESA) who received at least one dose of study drug, were included in the Safety Population. A total of 833 patients (413 roxadustat, 420 ESA) received at least one dose of study drug and had baseline and at least one post-dose Hb assessment were included in the FAS population.

Baseline demographics in the Safety Population were notable, as the majority of patients receiving hemodialysis (91.5% vs 96.4%, respectively), with a median time since first dialysis of 2.89 and 2.97 years, respectively.

Duration of exposure was comparable between the roxadustat group and ESA group (median: 103.71 weeks in roxadustat vs, 103.14 in ESA). Total PEY was 637.2 for roxadustat vs 719.7 for ESA.

In general, the efficacy data from Study 613 was consistent with other pivotal studies (Studies 063, 064 and 002).

Primary Endpoint: Mean Change in Hb from Baseline to Mean Over Weeks 28 to 52

The LSMean of the treatment difference between roxadustat and ESA was 0.171 (95% CI: 0.082, 0.261).

IV Iron Supplementation

Mean monthly IV iron use was 12.0 mg in the roxadustat treatment group compared with 44.8 mg in the ESA group. The LSMean difference for roxadustat vs ESA was -31.9 mg (95% CI: -41.4, -22.4); this difference was statistically significant (p < 0.001), which was consistent with other individual studies.

RBC Transfusion

9.4% roxadustat-treated patients vs 12.9% ESA-treated patients received RBC transfusion with a HR of 0.867 (95% CI: 0.573, 1.313) in FAS during the efficacy emergent period (up to OT+7), demonstrating the non-inferiority between roxadustat and ESA.

8.2. Cardiovascular Safety Data from Supportive Study 613

Study 613 was an open-label Phase 3 DD CKD study with an active comparator group that was unique in the use of 2 different ESAs, EPO or darbepoetin alfa, as active controls; therefore, the CV safety data from this study are not included in the pooled CV safety DD CKD analyses. Baseline demographics are shown in Table 54. Please see the Executive Summary (Section 1.1) for a review of the design and limitations of Study 613.

Note: Study 0613: randomized patients who took any dose of study medication in the DD study 0613.

Note: Active control is erythropoietin-stimulating agent: epoetin alfa or darbepoetin alfa.

Figure 71: Study 613: Forest Plot of MACE, MACE+, and ACM

Abbreviations: ACM=all-cause mortality; CI=confidence interval; DD=dialysis-dependent; ESA=erythropoiesis-stimulating agent; HR=hazard ratio; MACE=major adverse cardiovascular event (all-cause mortality, myocardial infarction, and stroke); MACE+=MACE, plus hospitalizations for unstable angina or congestive heart failure; OT+7=on-treatment plus 7 days.

Note: Study 613: randomized patients who took any dose of study medication in the DD Study 613.

Note: Active control is erythropoietin-stimulating agent: epoetin alfa or darbepoetin alfa.

Note: OT+7.

8.3. General Safety Data from Supportive Study 613

Study 613 general safety results were not pooled with the other Phase 3 pivotal dialysis studies as advised by FDA. The overall summary of AEs during the treatment period and within 28 days of the last dose of study medication are tabulated in Table 56. The overall incidence of AEs was similar between the treatment groups: 86.7% of patients in the roxadustat group and 86.0% in the ESA group. The percentage of patients with SAEs was 50.7% in the roxadustat group and 45.0% in the ESA group. The incidence of AEs leading to death was 16.2% in the roxadustat group compared to 13.1% in the ESA group. The percentage of patients with AEs leading to discontinuation of study medication was higher in the roxadustat group: 8.5% for roxadustat group vs 3.8% for ESA group.

Table 56: Study 613: Overview of Adverse Events and Death

	Roxadustat N=414	ESA N=420
	n (%)	n (%)
Any AE	359 (86.7)	361 (86.0)
Serious AE	210 (50.7)	189 (45.0)
AE leading to death	67 (16.2)	55 (13.1)
AE leading to withdrawal of treatment	35 (8.5)	16 (3.8)
Death during the safety emergent period (OT+28)	64 (15.5)	51 (12.1)

Abbreviations: AE=adverse event; ESA=erythropoiesis-stimulating agent; N=number of patients in treatment group; n=number of patients with specified AE.

The summary of AEs with $\geq 5\%$ incidence during the treatment period and within 28 days of the last dose of study medication are tabulated in Table 57. The most common AEs were hypertension (17.9% in the roxadustat vs 18.8% in the ESA group), AVF thrombosis (12.1% vs 7.4%) [AVF site complication (5.6% vs 5.0%)], headache (8.7% vs 6.9%), diarrhea (8.5% vs 8.3%) and bronchitis (8.0% vs 6.9%).

Table 57: Study 613: Roxadustat AEs (Incidence ≥ 5%) by Preferred Term Compared to Erythropoietin-Stimulating Agents

	Roxadustat	ESA
Preferred Term	N=414 n (%)	N=420 n (%)
Any AEs	359 (86.7%)	361 (86.0%)
Hypertension	74 (17.9%)	79 (18.8%)
Arteriovenous fistula thrombosis	50 (12.1%)	31 (7.4%)
Headache	36 (8.7%)	29 (6.9%)
Diarrhea	35 (8.5%)	35 (8.3%)
Bronchitis	33 (8.0%)	29 (6.9%)
Hypotension	33 (8.0%)	27 (6.4%)
Iron deficiency	30 (7.2%)	51 (12.1%)
Nausea	29 (7.0%)	8 (1.9%)
Viral upper respiratory tract infection	29 (7.0%)	39 (9.3%)
Pneumonia	23 (5.6%)	27 (6.4%)
Arteriovenous fistula site complication	23 (5.6%)	21 (5.0%)
Hyperparathyroidism secondary	22 (5.3%)	16 (3.8%)
Anemia	21 (5.1%)	16 (3.8%)
Atrial fibrillation	20 (4.8%)	25 (6.0%)
Muscle spasms	15 (3.6%)	33 (7.9%)
Upper respiratory tract infection	14 (3.4%)	22 (5.2%)
Fall	13 (3.1%)	21 (5.0%)

Abbreviations: AE=adverse event; ESA=erythropoiesis-stimulating agent; N=number of patients in treatment group; n=number of patients with the specified event; OT+28=on-treatment plus 28 days.

Note: Medical Dictionary for Regulatory Activities (MedDRA) coding dictionary version 20.0.

Note: Patients with more than one event in a category are counted only once for that category.

Note: OT+28.

The overall incidence of AEs leading to treatment discontinuation was higher in the roxadustat-treated patients; 8.5% in the roxadustat vs 3.8% in the ESA group. Individual AE leading to treatment discontinuation preferred terms were uncommon, with only acute coronary syndrome (2 [0.5%] vs 0 patients), acute myocardial infarction (2 [0.5%] vs 1 [0.2%]), cardiac arrest (0 vs 3 [0.7%]), death (2 [0.5%] vs 1 [0.2%]), sudden death (3 [0.7%] vs 0), sepsis (2 [0.5%] vs 0) and anxiety (2 [0.5%] vs 0) occurring in more than 1 patient in either treatment group.

8.4. Safety Assessment of Specific Adverse Events from Supportive Study 613

Some imbalances in specific AEs were noted during the review of safety data from the NDD and DD pools (Section 1.6.3). Table 58 presents a summary of those AEs for Study 613. A

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

greater proportion of patients in the roxadustat treatment group had VAT compared with the ESA treatment group. Eight patients had DVT AEs in the roxadustat group and none in the ESA group; in the roxadustat group, 3 patients had PE compared with 1 in the ESA group. The rate of seizure AEs was low in the roxadustat and ESA groups; 2 roxadustat-treated patients and 3 ESA-treated patients experienced seizure AEs during the study. The incidence of infection AEs was similar in the roxadustat and ESA treatment groups. While the incidence rate of infection SAEs was higher in the roxadustat group compared to ESA, the rate of adjudicated infection death was similar in the 2 groups.

Table 58: Study 613: Summary of Specific Adverse Events

	Roxadustat	ESA
	N=414	N=420

Abbreviations: AE=adverse event; MedDRA=Medical Dictionary for Regulatory Activities; N=number of patients in treatment group; n=number of patients with specified event; OT+28=on-treatment plus 28 days; SAE=serious adverse event; SMQ=standardized MedDRA query; SOC=System Organ Class.

9. SAFETY DATA FROM OTHER PHASE 3 CKD STUDIES

A total of 16 Phase 3 studies have been completed. Three NDD (Studies 001, 060, 608) and 3 DD studies (Studies 002, 063, 064) have been pooled, respectively, and have been presented in this document. Safety data from 2 global studies (Studies 610 and 613) were considered supportive and have been presented in Section 7 and Section 8, respectively. This section provides a summary of safety data from the remaining 8 studies (3 NDD studies; 5 DD studies). These were local studies conducted in Japan and China to support regulatory approval in these 2 countries, respectively.

9.1. Japan Studies

Six Phase 3 studies sponsored by Astellas Pharma were completed in Japan; 2 studies in NDD population (Studies 1517-CL-0310, 1517-CL-0314) and 4 studies in DD population (Studies 1517-CL-0302, 1517-CL-0307, 1517-CL-0308, 1517-CL-0312). A total of 1,028 patients have participated in these studies. The clinical study reports were submitted to the FDA.

9.1.1. Study 1517-CL-0310 (NDD)

This was a Phase 3 randomized open-label, active-controlled study to evaluate the efficacy and safety of roxadustat in the treatment of anemia in patients with NDD CKD (N=332). The incidence of AEs was 78.6% (103/131 patients) in the roxadustat (comparative) group, 70.2% (92/131 patients) in the darbepoetin alfa (comparative) group, and 77.1% (54/70 patients) in the roxadustat (referential) group. AEs occurring in \geq 5% of patients in any treatment group included nasopharyngitis, CKD, hyperkalemia, and hypertension. The incidence of all the events in the roxadustat (comparative) group was similar to or lower than that in the darbepoetin alfa (comparative) group. The incidence of SAEs was 17.6% in the roxadustat (comparative) group, 13.0% in the darbepoetin alfa (comparative) group, and 12.9% in the roxadustat (referential) group. In the roxadustat (comparative) group, no patients died during the study. Deaths were reported in 1 patient (due to gastrointestinal necrosis) in the darbepoetin alfa (comparative) group and 2 patients (due to PE and myocardial ischemia) in the roxadustat (referential) group. In conclusion, roxadustat was well-tolerated demonstrating an AE profile comparable to darbepoetin alfa.

9.1.2. Study 1517-CL-0314 (NDD)

This was a Phase 3 randomized open-label, noncomparative study to evaluate the efficacy and safety of roxadustat in ESA-untreated patients with renal anemia (N=99). The incidence of AEs was 62.6% (62/99 patients) in total. The common (incidence \geq 5%) AEs were nasopharyngitis (20.2%), hypertension (6.1%), and diarrhea and hyperkalemia (5.1% each). The incidence of serious AE was 11.1% (11/99 patients) in total. The incidence of AEs leading to withdrawal of treatment was 6.1% (6/99 patients) in total. The incidence of drug-related AEs leading to withdrawal of treatment was 2.0% (2/99 patients) in total. No deaths were observed. In conclusion, roxadustat was well-tolerated and was consistent with other completed studies.

FibroGen

9.1.3. Study 1517-CL-0302 (DD)

This was a Phase 3 randomized multicenter, open-label, non-comparative study of the treatment of anemia in patients with CKD (N=56). The overall incidence of AEs was 87.5% (49/56 patients). The incidence of AEs was similar between the roxadustat treatment groups based on dose. The most common (incidence $\geq 5\%$) AEs in all the treatment groups were nasopharyngitis, back pain, catheter site infection, diarrhea, vomiting, abdominal pain, conjunctivitis, constipation, nausea and pruritus. The incidence of these events except for back pain and conjunctivitis in the pooled ESA-treated group was higher than that in the pooled ESA-untreated group. All AEs in all the treatment groups were mild or moderate in severity. No severe AEs were reported in any treatment group and there were no deaths in this study. A SAE which occurred in 2 or more patients in total was peritonitis (3.6%, 2/56 patients). One patient taking pravastatin experienced serious AE of rhabdomyolysis which was assessed as possibly related to roxadustat. In addition, to the roxadustat and pravastatin, febuxostat was also considered a suspect medication. Overall, roxadustat was well-tolerated demonstrating an AE profile similar to the underlying population of patients with anemia and CKD.

9.1.4. Study 1517-CL-0307 (DD)

This was a Phase 3 randomized multicenter, 2-arm parallel, double-blind, active comparator (darbepoetin alfa) conversion study of intermittent oral dosing of roxadustat in patients with DD CKD with anemia (N=303). The incidence of AEs was 86.0% (129/150 patients) in the roxadustat group and 82.9% (126/152 patients) in the darbepoetin alfa group. The most common (incidence > 5% in any arm) AEs were nasopharyngitis, shunt stenosis, diarrhea, contusion and vomiting. Of these, the events occurring more frequently in the roxadustat group compared with the darbepoetin alfa group were nasopharyngitis and vomiting. The incidence of SAEs was 20.7% (31/150 patients) in the roxadustat group and 14.5% (22/152 patients) in the darbepoetin alfa group. SAEs observed in 2 or more patients in the roxadustat group were shunt stenosis (4.0%, 6/150 patients), shunt occlusion (2.0%, 3/150 patients), cellulitis and DVT (1.3%, 2/150 patients each). Two deaths (1.3%, 2/150) were reported in the roxadustat group. One in a 64-year-old male patient that was on dialysis for 41 years and had a medical history of acute pericarditis and chronic heart failure died from acute myocardial infarction; the second case in a 75-year-old male patient with a history of hypertension, angina pectoris, hyperkalemia, and dyslipidemia who died from cardiopulmonary arrest due to congestive cardiac failure.

9.1.5. Study 1517-CL-0308 (DD)

This was a Phase 3 multicenter, randomized, 2-arm, open-label study of intermittent oral dosing of roxadustat in erythropoiesis-stimulating agent-naive patients with DD CKD with anemia (N=75). The incidence of AEs was 86.5% (21/37 patients), 94.7% (36/38 patients), and 90.7% (68/75 patients) in the roxadustat 50 mg, 70 mg groups, and total, respectively. The most common (incidence \geq 5%) AEs were nasopharyngitis (20.0%), dermatitis contact (13.3%), shunt occlusion (9.3%), constipation, shunt stenosis and hyperphosphatemia (6.7% each), and diarrhea, vomiting, eczema, contusion, back pain and insomnia (5.3% each). The incidence of SAEs was 29.3% (22/75 patients) in total. SAEs observed in more than 1 patient were shunt occlusion 6.7% (5/75 patients) and cardiac failure congestive 2.7%

FibroGen

(2/75 patients). No deaths were observed. The 50 mg starting dose group tended to be associated in general with a numerically lower AE rate compared to the 70 mg starting dose group. In conclusion, roxadustat was well-tolerated demonstrating an AE profile similar to the underlying population of patients with anemia and CKD.

9.1.6. Study 1517-CL-0312 (DD)

This was a long-term study of intermittent oral dosing of roxadustat in patients with DD CKD with anemia converted from ESA treatment (N=163). The overall incidence of AEs was 95.7% (156/163 patients) in total. The common (incidence > 5%) AEs in total were nasopharyngitis (52.8%), diarrhea (11.0%), vomiting (10.4%), contusion (9.8%), shunt stenosis, back pain (7.4% each), constipation, shunt occlusion (6.1% each), dental caries, and headache (5.5% each). According to the analysis for onset of AEs by time interval, there was no increase in the incidence of AEs dependent on the roxadustat administration period. The incidence of SAEs was 28.2% (46/163 patients) in total. SAEs observed in 2 or more patients were shunt occlusion (5.5%, 9/163 patients), angina pectoris, pneumonia (1.8%, 3/163 patients each), myocardial ischemia, shunt stenosis, arteriogram coronary, skin ulcer, and peripheral arterial occlusive disease (1.2%, 2/163 patients each). The incidence of deaths was 1.2% (2/163 patients) in total, and no relationships with roxadustat were found. A 79year-old male patient died of pancreatic carcinoma and 67-year-old male patient died of hemorrhagic shock which was attributed to bleeding from multiple gastric and duodenal ulcers. The cause of the ulcers was unknown; however, it was considered that sepsis had a major influence. In conclusion, roxadustat was well-tolerated demonstrating an AE profile similar to the underlying population of patients with anemia and CKD.

9.2. China Studies

Two Phase 3 studies sponsored by FibroGen China were completed in China; one in NDD population (Study FGCL-4592-808) and one in DD population (Study FGCL-4592-806). A total of 456 patients have participated in these studies. The clinical study reports were submitted to the FDA.

9.2.1. Study FGCL-4592-808 (NDD)

This Phase 3 randomized, multicenter, double-blind, placebo-controlled study of the treatment of anemia in patients with NDD CKD (N=152) had an 8-week double-blind treatment period with roxadustat or placebo, an 18-week open-label treatment period and an extension period for 26 additional weeks for the patients who were randomized to roxadustat.

During the double-blind treatment period, 69 (68.3%) patients in the roxadustat arm and 38 (74.5%) patients in the placebo arm reported AEs. The most commonly reported AEs higher on the roxadustat treatment arm than placebo included hyperkalemia, metabolic acidosis, peripheral edema, and hypertension. There was no specific safety signal or clustering of SAEs detected in either arm, and no deaths were reported during this study period.

During the 18-week open-label treatment period, a combined total of 112 (87.5%) patients reported AEs. The most commonly reported AEs were ESRD/CKD, hyperkalemia, hypertension, upper respiratory tract infection, and metabolic acidosis, events commonly

FibroGen

encountered in this patient population. A total of 33 patients (25.8%) reported at least one SAE during this period of the study. Two deaths (2.4%) were reported during this study period: a 69-year-old female developed a sudden loss of consciousness at home without complaints of discomfort prior to the event and died before reaching hospital and a 60-year-old female died from post-operative retroperitoneal hemorrhage secondary to a surgical complication. Both deaths were considered by the investigators as not related to study drug.

In the 26-week extension period, 20 (87%) reported AEs. The most common AEs were hyperkalemia, metabolic acidosis, upper respiratory tract infection, hypertension, and iron deficiency. The AEs reported in the 52-week extension treatment period were similar to the initial treatment period. During the extension treatment period, 8 (34.8%) of patients reported treatment-emergent SAEs. No deaths occurred during the extension treatment period.

Overall, roxadustat was evaluated to be safe and well-tolerated in this NDD patient population.

9.2.2. Study FGCL-4592-806 (DD)

This Phase 3 randomized, multicenter, open-labeled, active-controlled study in patients with anemia associated with CKD who were on dialysis (N=304) had a 26-week treatment period and an extension period for up to 26 additional weeks for the patients who were randomized to roxadustat.

During the initial treatment period, a total of 160 (78.4%) patients in the roxadustat arm reported AEs, while 64 (64.0%) in the EPO arm reported AEs. The most common AEs that were reported in greater proportion in the roxadustat arm over the EPO arm were events of upper respiratory tract infection, hyperkalemia, chest discomfort, vomiting, and asthenia. The roxadustat-treated patients reported a slightly higher proportion (15.7%, including 1.5% hospitalized for routine dialysis treatment) of SAEs compared to the EPO-treated patients (10.0%). However, there was no important safety signal detected in the roxadustat arm.

Among 32 patients reported with SAEs in the roxadustat arm, 3 deaths occurred during the initial treatment period: a 65-year-old male died from an acute myocardial infarction, a 61-year-old male died from gastrointestinal hemorrhage and a 57-year-old female, died from cardiac failure. All 3 deaths were assessed by the investigators and by the Sponsor to be unrelated to study medication.

In the extension treatment period, a total of 96 (86.5%) patients reported AEs, most of which were mild or moderate in severity. The most common AEs reported were upper respiratory tract infection (31.5%), hypertension (15.3%), and hyperkalemia (9.9%). Two deaths were reported: one 64-year-old male who died from gastrointestinal perforation prior to surgical intervention, and another 52-year-old female with a history of hypertension who died from cerebral hemorrhage. None of these 2 deaths were considered related to study drug. Seventeen (15.3%) patients reported SAEs, the most common being AVF site stenosis/thrombosis (5 patients) in hemodialysis patients. Two peritoneal dialysis patients reported peritonitis.

FibroGen

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

Overall, roxadustat was considered to be safe and well-tolerated in this DD patient population.

Roxadustat Cardiovascular and Renal Drugs Advisory Committee

10. DISPOSITION TABLES

A total of 4,270 eligible patients from the 3 pivotal Phase 3 studies were randomized to roxadustat (N=2,386) or placebo (N=1,884) and received at least 1 dose of study treatment. Substantially more patients in the placebo group discontinued study treatment prematurely compared to roxadustat. The main reasons for discontinuation were withdrawal by patient, AEs, and development of study specific discontinuation criteria related to requirement for rescue therapy (ie, RBC transfusion, ESA use, and IV iron supplementation) due to lack of efficacy of study drug (Table 59). These imbalances in disposition led to greater duration of treatment in the roxadustat group and retention of higher-risk patients (eg, those with low eGFR and those who required dialysis initiation) in the roxadustat group compared to the placebo group over time, leading to bias and confounding in on-treatment safety analyses.

Table 59: Pooled NDD Studies: Reasons for Discontinuation

NDD (Studies 608, 060, 001)	Roxadustat	Placebo
ITT Population	2391	1886
Main Reasons for Discontinuation, n (%):		
Adverse Event	150 (6.3)	83 (4.4)
Death ^b	81 (3.4)	30 (1.6)
Development of Study Specific Discontinuation Criteria ^a	76 (3.2)	252 (13.4)
Dialysis Initiation	23 (1.0)	11 (0.6)
Kidney Transplant	24 (1.0)	9 (0.5)
Lack of Efficacy	7 (0.3)	74 (3.9)
Lost to Follow-up	33 (1.4)	8 (0.4)
Non-compliance to Protocol	23 (1.0)	20 (1.1)
Not Reported	2 (0.1)	3 (0.2)

Study Terminated by Sponsor	2 (0.1)	0
Patient Decision	250 (10.5)	390 (20.7)
Patient Relocated/Moved (or Lost to Follow-up)	6 (0.3)	10 (0.5)
Withdrawal by Parent/Guardian	1 (0.0)	1 (0.1)
Withdrawal by Patient	143 (6.0)	143 (7.6)
Other	28 (1.2)	13 (0.7)

Abbreviations: ITT=intent-to treat; NDD=non-dialysis-dependent.

A total of 1943 patients were randomized in the roxadustat group and 1947 in the EPO group for a total of 3,890 patients who were included in the ITT set. A total of 1940 patients in each group received at least 1 dose of study drug and were included in the Safety Analysis Set. The ID-DD subpopulation consisted of 1,530 patients, and the SDD subpopulation consisted of 2,360 patients.

The main reasons for premature treatment discontinuation were withdrawal by patient, AEs, death, and kidney transplant (Table 60).

^a In Study 001, patients reported "study specific discontinuation criteria" were patients who were discontinued from study drug for initiating dialysis during the study, and for whom there was a need for rescue with erythropoietin analogue.

^b In Table 36 in Section 6.4.1 patients who died while on treatment were considered to have completed treatment and completed the study.

11. DOSE MODIFICATION MODEL

Figure 72: Roxadustat Starting Dose Modifications

Roxadustat acts at two points in the model via the effect compartment

Hemoglobin synthesis stimulus: $G(STM) = \frac{EMAX \cdot STM^{Gamma}}{STM^{Gamma} + EC50^{Gamma}}$

• Pre-curser depletion stimulus : $H(STM) = \frac{Dcal \cdot EMAX \cdot STM^{Gamma}}{STM^{Gamma} + \tau \cdot EC50^{Gamma}}$

Abbreviations: Dcal=depletion calibration; EC50=concentration that achieves 50% of the effect; EMAX=maximum effort; HB=hemoglobin; Kee=roxadustat elimination rate constant; Khb=rate constant for elimination of Hb; Kp=precursor production rate constant; Prec=Hb precursor; Roxa=roxadustat.

FDA CRDAC July 15 2021 11

1 PROCEEDINGS (9:30 a.m.)2 Call to Order 3 DR. LEWIS: Good morning and welcome. I 4 would like to remind everyone to please mute your 5 line when you are not speaking. For media and 6 7 press, the FDA press contact is Chanapa Tantibanchachai. Her email and phone number are 8 currently displayed. 9 My name is Julia Lewis, and I will be 10 chairing this meeting. I will now call the 11 July 15, 2021 meeting of the Cardiovascular and 12 Renal Drugs Advisory Committee to order. Dr. Joyce 13 Yu is the designated federal officer for this 14 meeting and will begin with introductions. 15 Introduction of Committee 16 DR. YU: Good morning. My name is Joyce Yu, 17 18 and I'm the designated federal officer for this 19 meeting. When I call your name, please introduce yourself by stating your name and affiliation. 20 21 We'll start with Ms. Alikhaani. MS. ALIKHAANI: Good morning. I'm 22

FDA CRDAC July 15 2021

12

```
Jacqueline Alikhaani. I live in Los Angeles.
1
     a heart patient and volunteered citizen scientist.
2
      I'm a community health volunteer with the American
3
4
     Heart Association and PCORI, the Patient-Centered
     Outcomes Research Institute, and the University of
5
     California, Los Angeles.
6
             DR. LEWIS:
7
                          Thank you.
             Dr. Bairey Merz?
8
9
             DR. BAIREY MERZ: Good morning. Noel Bairey
             I'm a clinical and investigative
10
     Merz.
      cardiologist at Cedars-Sinai Medical Center in Los
11
     Angeles, with the specialties of ischemic heart
12
      disease and women's heart disease.
13
             DR. YU: Thank you.
14
             Dr. Cook?
15
             DR. COOK: This is Thomas Cook. I'm a
16
     biostatistician at the University of
17
18
     Wisconsin-Madison, where I specialize in clinical
     trials.
19
             DR. YU: Thanks.
20
21
             Dr. Kasper?
             DR. KASPER: Good morning. Kevin Kasper.
22
```

July 15 2021

13

```
I'm a cardiologist at Johns Hopkins with interest
1
      in heart failure and heart transplantation.
2
3
             DR. YU: Thank you.
             Dr. Lewis?
4
             DR. LEWIS: Good morning. I'm Dr. Julia
5
            I'm a nephrologist at Vanderbilt
6
7
     University. Thank you.
             DR. LEWIS: Dr. Moliterno?
8
             DR. MOLITERNO: Hi. David Moliterno.
9
     professor of medicine and cardiologist at the
10
     University of Kentucky.
11
             DR. YU: Thanks.
12
             Dr. O'Connor?
13
             DR. O'CONNOR: Good morning. Chris O'Connor
14
             I'm a heart-failure cardiologist interested
15
      in heart-failure clinical trials and also serve as
16
     president of the Inova Heart and Vascular Institute
17
18
     health system outside Washington DC.
19
             DR. BAIREY MERZ: Dr. Thadhani?
             DR. THADHANI: Good morning. My name is
20
21
     Ravi Thadhani. I'm the chief academic officer at
     Mass General Brigham and a nephrologist by
22
```

```
1
      training.
                 Thank you.
                      Unfortunately, Dr. Abbott is not
             DR. YU:
2
      able to participate today, in today's meeting.
3
4
     had an emergency. So we'll move on to Dr. Cho.
              (No response.)
5
                      Dr. Cho, you're muted in the Adobe
6
     Connect. Would you mind unmuting?
7
              (Pause.)
8
             DR. CHO: Hi. Leslie Cho, professor of
9
     medicine, interventional cardiologist at Cleveland
10
     Clinic.
11
12
             DR. YU:
                      Thank you so much.
             Mr. Conway?
13
                          Hi. My name is Paul Conway.
14
             MR. CONWAY:
      serve as chair of Policy and Global Affairs at the
15
     American Association of Kidney Patients, and I'm a
16
      40-year kidney patient. Thank you.
17
18
             DR. YU: Dr. Crowley?
19
             DR. CROWLEY: Yes. Hi.
                                       I'm a nephrologist
      for the Veterans Health Administration and a
20
21
     professor of medicine at Yale University.
             DR. YU: Dr. Packer?
22
```

FDA CRDAC July 15 2021

```
DR. PACKER: Yes. I'm a cardiologist at
1
     Baylor University Medical Center with a focus on
2
      clinical trials. I guess I should just state for
3
4
     the record that there is a waiver in my name that
     has given me an extra degree. I do not have an MPH
5
     degree. So Joyce, I just wanted to put that in for
6
     the record.
7
             DR. YU: Thanks, Dr. Packer.
8
             DR. PARSA: Good morning. I'm Afshin Parsa.
9
      I'm a nephrologist and senior scientific advisor at
10
      the National Institutes of Health.
11
             DR. YU: Dr. Wang?
12
13
             DR. WANG: Hi. I'm Tommy Wang.
      cardiologist and chair of medicine at
14
     UT Southwestern Medical Center.
15
             DR. YU: Dr. Soergel?
16
             DR. SOERGEL: Good morning. David Soergel.
17
18
      I'm a pediatric cardiologist industry
19
      representative from Novartis.
             DR. YU: We'll move on to our FDA
20
21
     participants.
22
             Dr. Unger?
```

FDA CRDAC July 15 2021 16

```
I'm Ellis Unger.
1
             DR. UNGER:
                                             I'm a
     cardiologist and the director of the Office of
2
      Cardiology, Hematology, Endocrinology, and
3
4
     Nephrology in the Office of New Drugs, Center for
     Drug Evaluation and Research at FDA.
5
             DR. YU: Thanks.
6
             Dr. Farrell?
7
              (No response.)
8
                     Dr. Farrell, go ahead and unmute in
9
             DR. YU:
      the Adobe Connect at the top of your screen at the
10
     phone icon. I think you're muted there.
11
12
             DR. FARRELL:
                           Hello. My name is Ann
     Farrell. I'm a hematologist and medical
13
      oncologist, and I'm the division director of the
14
     Division of Non-Malignant Hematology in the Office
15
     of Cardiology, Hematology, Nephrology, and
16
     Endocrinology. Thank you.
17
18
             DR. YU:
                      Thanks, Dr. Farrell.
19
             Dr. Ayache?
             DR. AYACHE:
                          My name is Dr. Saleh Ayache.
20
21
      I'm a medical officer in the Division of
     Non-Malignant Hematology in the Office of
22
```

FDA CRDAC July 15 2021

Cardiology, Hematology, Endocrinology, and 1 Nephrology. 2 DR. YU: And finally, Dr. Jae Joon Song? 3 DR. SONG: Good morning. My name is Dr. Jae 4 Joon Song, and I am a statistical reviewer at the 5 FDA Center for Drug Evaluation and Research, Office 6 of Biostatistics. 7 DR. YU: I'll hand it over to you, 8 Dr. Lewis. 9 10 DR. LEWIS: Thank you. For topics such as those being discussed at 11 12 this meeting, there are often a variety of opinions, some of which are quite strongly held. 13 Our goal is that this meeting will be a fair and 14 open forum for discussion of these issues and that 15 individuals can express their views without 16 interruption. 17 18 Thus, as a gentle reminder, individuals will 19 be allowed to speak into the record only if recognized by the chairperson. We look forward to 20 21 a productive meeting. In the spirit of the Federal Advisory 22

FDA CRDAC July 15 2021

Committee Act and the Government in the Sunshine

Act, we ask that the advisory committee members

take care that their conversations about the topic

at hand take place in the open forum of the

meeting.

We are aware that members of the media are anxious to speak with the FDA about these proceedings, however, FDA will refrain from discussing the details of this meeting with the media until its conclusion. Also, the committee is reminded to please refrain from discussing the meeting topic during breaks or lunch. Thank you.

Dr. Joyce Yu will now read the Conflict of Interest Statement for the meeting.

Conflict of Interest Statement

DR. YU: The Food and Drug Administration is convening today's meeting of the Cardiovascular and Renal Drugs Advisory Committee under the authority of the Federal Advisory Committee Act of 1972.

With the exception of the industry representative, all members and temporary voting members of the committee are special government employees, SGEs,

FDA CRDAC July 15 2021 19

or regular federal employees from other agencies and are subject to federal conflict of interest laws and regulations.

The following information on the status of this committee's compliance with federal ethics and conflict of interest laws, covered by but not limited to those found at 18 U.S.C. Section 208, is being provided to participants in today's meeting and to the public.

temporary voting members of this committee are in compliance with federal ethics and conflict of interest laws. Under 18 U.S.C. Section 208, Congress has authorized FDA to grant waivers to special government employees and regular federal employees who have potential financial conflicts when it is determined that the agency's need for a special government employee's services outweighs his or her potential financial conflict of interest, or when the interest of a regular federal employee is not so substantial as to be deemed likely to affect the integrity of the services

July 15 2021

20

which the government may expect from the employee. 1 Related to the discussions of today's 2 meeting, members and temporary voting members of 3 this committee have been screened for potential 4 financial conflicts of interest of their own as 5 well as those imputed to them, including those of 6 their spouses or minor children and, for purposes 7 of 18 U.S.C. Section 208, their employers. 8 interests may include investments; consulting; 9 expert witness testimony; contracts, grants, 10 CRADAs; teaching, speaking, writing; patents and 11 12 royalties; and primary employment. Today's agenda involves discussion of the 13 14 new drug application 213805, for the hypoxia inducible factor prolyl hydroxylase inhibitor, 15 roxadustat tablets, submitted by FibroGen, 16 Incorporated, for the treatment of anemia due to 17 18 chronic kidney disease in adult patients not on 19 dialysis and on dialysis. This is a particular matters meeting during which specific matters 20 21 related to FibroGen's NDA will be discussed. Based on the agenda for today's meeting and 22

July 15 2021

all financial interests reported by the committee members and temporary voting members, a conflict of interest waiver has been issued in accordance with 18 U.S.C. Section 208(b)(3) to Dr. Milton Packer. Dr. Packer's waiver involves stock holdings in affected firms.

The waiver allows this individual to participate fully in today's deliberations. FDA's reasons for issuing the waivers are described in the waiver document, which is posted on FDA's website at: https://www.fda.gov/advisory-committees/committees-and-meeting-materials/human-drug-advisory-committees.

Copies of the waiver may also be obtained by submitting a written request to the agency's Freedom of Information division, 5630 Fishers Lane, Room 1035, Rockville, Maryland, 20857, or requests may be sent via fax to 301-827-9267. To ensure transparency, we encourage all standing committee members and temporary voting members to disclose any public statements that they have made concerning the product at issue.

FDA CRDAC July 15 2021

With respect to FDA's invited industry 1 2 representative, we would like to disclose that Dr. David Soergel is participating in this meeting 3 4 as a non-voting industry representative, acting on behalf of regulated industry. Dr. Soergel's role 5 at this meeting is to represent industry in general 6 and not any particular company. Dr. Soergel is 7 employed by Novartis. 8 We would like to remind members and 9 temporary voting members that if the discussions 10 involve any other products or firms not already on 11 the agenda for which an FDA participant has a 12 13 personal or imputed financial interest, the participants need to exclude themselves from such 14 involvement, and their exclusion will be noted for 15 16 the record. FDA encourages all other participants to advise the committee of any financial 17 18 relationships that they may have with the firm at issue. 19 Thank you. DR. LEWIS: We will proceed with FDA opening 20 21 remarks from Dr. Ellis Unger. Dr. Unger? 22

July 15 2021

FDA Opening Remarks - Ellis Unger

DR. UNGER: Hi, and good morning, again, everyone. I'd like to welcome all of you to this advisory committee meeting and in advance of the proceedings, I'd like to take the opportunity to thank the committee, the patient and industry reps, registered public speakers, the applicant, and last but not least, the patients and interested parties who are listening online for all your efforts and interest in this application.

We'll be discussing roxadustat for the treatment of anemia of chronic kidney disease, and it's a complex application. It raises several important issues. We convened this meeting because we sincerely seek the committee's opinions and advice here. As usual, I'll remind you that although your votes are important, the discussion and the rationale behind your votes will likely be even more valuable to us.

Now typically, the division director would make the remarks here, but Dr. Ann Farrell has allowed me the honor of speaking in her place

July 15 2021

because, as she puts it, I have a passion for these patients and these therapies.

I've always felt that patients with chronic kidney disease deserve a better deal. Almost exactly 20 years ago, when I was fairly new at FDA, I was the medical officer who reviewed the application for darbepoetin alfa, which we approved, and it's still marketed for the anemia of chronic kidney disease.

When I was just beginning that review, I remember my supervisor telling me that we already knew that the drug could be titrated to raise the hemoglobin level to its target. That wasn't the issue. The question was whether it could do so safely. And that's exactly the same question we face today, but now the question is for the first drug in an entirely new class, and it's the first oral drug for this indication.

The applicant's hope was that roxadustat would be as effective as the approved erythropoiesis stimulating agents, and I think that we all hoped perhaps it would be safer. The

FDA CRDAC July 15 2021 25

development program was robust. It was aimed to show roxadustat's efficacy and safety in patients who were on and not on dialysis.

The main studies in the dialysis population were combined and the main studies in the non-dialysis populations were combined, and meta-analyses were conducted to examine major adverse cardiovascular events in both of these populations.

Now you'll see that the results of these analyses are somewhat difficult to interpret, as they're sensitive to the duration that patients were followed after they discontinued treatment, and we'll be discussing this in some detail.

In the non-dialysis population, patients with significant anemia were randomized to placebo, and not surprisingly, there were many more discontinuations in the placebo groups than in the roxadustat groups, which to some extent confounded the safety analyses.

With respect to the standard analyses of safety, there were greater rates of some important adverse events with roxadustat than even epoetin

FDA CRDAC July 15 2021 26

alfa, thrombotic events in particular. The absolute risks per patient-year are not large, but the adverse events are obviously important. Some of those events were thrombosis of vascular access, which is a lifeline in dialysis patients.

Twenty years ago, I advanced a theory, based on my analyses within the darbepoetin alfa application, that a rapid rate of rise in hemoglobin might lead to adverse events, maybe secondary to increases in blood viscosity. Our biometrics team performed these analyses for roxadustat, and indeed they found associations between hemoglobin rate of rise and thrombotic events. But you'll see that these analyses are based on, really, very small numbers of adverse events and are, at best, associations.

In recent discussions with the applicant, they've embraced the view that roxadustat's risks may be reduced with a more conservative dosing strategy that would limit the hemoglobin rate of rise, but I'll note that the rate-of-rise hypothesis remains unproven, and their plan is

untested, but we'll discuss it.

Finally and importantly, I want to emphasize that our approval standards are based on demonstration that a drug is safe and effective and that there are adequate instructions for use. generally don't reject drugs based on comparative effectiveness or comparative safety, although we do consider the benefits and risks of new drugs within the context of available therapies.

So with that, I'll cede the floor, the virtual floor, for your presentations and deliberations. And again, I thank you so much for your participation.

> DR. LEWIS: Thank you, Dr. Unger.

Both the Food and Drug Administration and the public believe in a transparent process for information gathering and decision making. ensure such transparency at the advisory committee meeting, FDA believes that it is important to understand the context of an individual's presentation.

For this reason, the FDA encourages all

FDA CRDAC July 15 2021

participants, including FibroGen's non-employee presenters, to advise the committee of any financial relationships they may have with the sponsor such as consulting fees, travel expenses, honoraria, and interest in the sponsor, including equity interests and those based upon the outcome of the meeting.

Likewise, FDA encourages you at the beginning of your presentation to advise the committee if you do not have any such financial relationships. If you choose not to address this issue of financial relationships at the beginning of your presentation, it will not preclude you from speaking.

 $\label{eq:weighted_problem} \mbox{We will now proceed with presentations from} \\ \mbox{FibroGen.}$

Applicant Presentation - Wayne Frost

DR. FROST: Good morning, members of the Cardiovascular and Renal Drugs Advisory Committee and the FDA. I'm Wayne Frost, senior vice president of regulatory affairs at FibroGen, and we're excited to be here today with our partner

July 15 2021

AstraZeneca to share the data for roxadustat for the treatment of anemia in patients with chronic kidney disease.

Roxadustat is a novel, oral therapy to treat patients with anemia of CKD and the first major innovation in the management of this condition in 30 years. Patients with anemia of CKD need options beyond existing therapies.

Anemia is a common and burdensome complication of CKD that is associated with undesirable clinical outcomes. Many patients are underserved, especially those who are not on dialysis due to the complexities of injectable treatments, resulting in an unacceptable risk of red blood cell transfusion.

There is also a need for alternative treatment options for dialysis patients who respond inadequately to ESAs and those on home dialysis. Patients with anemia of CKD would benefit from having the choice of an oral treatment option that can be continued throughout their entire clinical course.

July 15 2021

Roxadustat is a first-in-class oral therapy designed to consistently correct and maintain hemoglobin across the spectrum of patients with CKD anemia. Its novel mechanism of action is based on an oxygen-sensing pathway, a discovery that was awarded the 2019 Nobel Prize in physiology or medicine.

It's a small molecule inhibitor of
hypoxia-inducible factor prolyl hydroxylase, or
HIF-PH, the enzyme that regulates HIF activity.
HIF is responsible for coordinating a physiologic
response to decrease the oxygen levels. By
transiently inhibiting the enzyme, roxadustat
increases hemoglobin by mimicking the body's
natural response to low oxygen.

Now, let's take a closer look at its novel mechanism of action. Under normal oxygen conditions, HIF-PH enzymes hydroxylate the alfa subunit of HIF. This hydroxylation targets the HIF-alfa subunit for rapid degradation via the proteasome. When oxygen levels fall, HIF-PH enzymes become inactive and HIF-alfa degradation is

FDA CRDAC July 15 2021 31

This allows the formation of an active. prevented. HIF transcription factor, which leads to increased expression of HIF target genes, including those involved in erythropoiesis. This same pathway can be pharmacologically activated by roxadustat, which inhibits the HIF-PH enzymes. Roxadustat stimulates a coordinated erythropoietic response the same way the body naturally responds to low oxygen. This coordinated erythropoietic response is a key differentiator between roxadustat and currently available treatments for patients with CKD anemia. ensures sufficient iron availability for effective erythropoiesis to occur in the presence of physiologic levels of EPO. This is in contrast to ESAs that do not stimulate a coordinated erythropoietic response, and therefore lead to

We've worked closely with the FDA to design and adapt our phase 3 clinical development program.

At the end of the phase 2 meeting in 2012, FDA

supraphysiologic levels of EPO to increase red

blood cell production.

FDA CRDAC July 15 2021

requested that our program be powered to assess CV safety for the NDD and DD population separately as a result of CV safety concerns for ESAs, which we did.

Our first phase 3 study started shortly after that meeting and our pivotal phase 3 studies were completely enrolled in 2018. At our pre-NDA meeting in July of 2019, we reached agreement with the FDA on the final pooling strategy and the analytical methods to use for the evaluation of the ND and DD populations, respectively. We then submitted our NDA in December of 2019. Additionally, roxadustat is approved in China and Japan, and on June 24th, we received a positive opinion from the CHMP for the approval of roxadustat in the EU.

Now, let me share the clinical development program. We've conducted an extensive CKD clinical development program, which includes more than 13,000 patients. Nine phase 2 studies informed the sponsor in the development of the phase 3 program.

Since patients with CKD anemia who are

July 15 2021

dialysis-dependent and not dialysis-dependent are quite different populations, we've conducted several studies in each group. Three NDD studies have been pooled in agreement with the FDA. These include Studies 001, 060, and 608, and three studies in dialysis-dependent patients have been pooled in agreement with the FDA. These include Studies 002, 063, and 064. Additionally, we'll show supportive evidence from Study 610 that compared roxadustat to an active control in NDD patients.

Six phase 3 studies were sponsored by

Astellas Pharma and conducted in Japan, two in NDD

patients and four in DD patients. Two phase 3

studies were sponsored by our affiliate in China

and conducted in China, one in each population.

Data from Study 613 and safety data from these additional studies have been presented in the briefing book for your reference. Our presentation will focus mainly on the results from our six pivotal phase 3 studies that demonstrate the efficacy and safety of roxadustat.

FDA CRDAC July 15 2021 34

Today you will see that roxadustat's efficacy and safety, including CV safety, was consistently demonstrated across the spectrum of patients with CKD. This includes patients not on dialysis and those on dialysis, whether recently started or stable and independent of information inflammation and iron status.

Each of our six pivotal studies met its

primary efficacy endpoint of mean change from

baseline in hemoglobin. Roxadustat showed a

statistically significant and clinically meaningful
improvement versus placebo in the NDD trials and

was comparable to ESA in the DD trials.

Additionally, roxadustat demonstrated a reduction
in red blood cell transfusions.

The CV safety profile of roxadustat was comparable to placebo in NDD and epoetin alfa in DD and the general safety profile appears to be acceptable. The totality of the evidence supports the use of roxadustat to increase and maintain hemoglobin levels for patients with CKD anemia who need additional treatment options. Our proposed

July 15 2021

indication is for the treatment of anemia due to CKD in adult patients not on dialysis and on dialysis.

With that background, I'll take you through the agenda. Next, Roberto Pecoits will describe the significant unmet need in patients with CKD anemia; then Dr. Lynda Szczech will present the efficacy data from our clinical program; followed by Dr. Dustin Little, who will present roxadustat's safety profile. Finally, Dr. Steven Fishbane will give his clinical perspective and conclude our presentation.

All external experts have been compensated for their time. We also have experts from FibroGen and AstraZeneca with us to help address your questions. Thank you. I will now turn the presentation over to Dr. Pecoits.

Applicant Presentation - Roberto Pecoits-Filho

DR. PECOITS-FILHO: Good morning. I'm a practicing nephrologist caring for patients with anemia CKD for 20 years. My research focus has been to observe practice patterns across the

FDA CRDAC July 15 2021

spectrum of CKD, and I was an investigator in several of the recent CKD anemia trials. From this perspective, I'll highlight the limitations of current therapies and discuss the unmet medical need for patients with anemia CKD.

To understand and appreciate the unmet need, we must consider the CKD patient journey and how several factors influence our treatment decisions.

CKD progresses across stages as kidney function declines. When eGFR approaches 15 mL per minute, some patients and their nephrologists would opt for non-dialytic conservative management. The majority begins that transition to dialysis why a few prepare for a transplant, clearly the superior form of kidney replacement therapy.

Currently in the U.S., 88 percent of patients receive in-center hemodialysis, while 11 percent receive peritoneal dialysis, and 2 percent home hemodialysis. Utilization of home dialysis is quite low and transplants are infrequent. However, there's great interest from clinicians and patients in increasing their use,

FDA CRDAC July 15 2021

and current standard of care for anemia management presents limitations to achieve this.

With each advancing stage of CKD, the prevalence and severity of anemia increases. The dark blue bars represent the proportion of patients who are potentially in need for anemia treatment, with hemoglobin levels lower than 10 grams per deciliter. Note that one-third of stage 5 are candidates for treatment. Patient symptoms, which worsen as CKD progresses, are important drivers to begin anemia treatment.

Let me now briefly review the pathophysiology of anemia in CKD. In healthy individuals, as oxygen tension decreases in kidney and liver, the stabilization of hypoxia-inducible factor promotes the production of erythropoietin and induces the release of iron into the circulation. Epo stimulates the differentiation of stem cells in the bone marrow, and available iron is utilized in the synthesis of hemoglobin and maturation of red blood cells.

In an anemia CKD, this process is disrupted,

July 15 2021

but current treatment options have limited actions in this complex pathophysiology. While erythropoiesis stimulated agents, or ESAs, target step 4, iron supplementation targets step 5. HIF stabilization and its downstream consequences are simply not addressed.

Now let's review the current standards of care and its significant limitations. Our current treatment options are ESA, iron therapy, and for those not responding, blood transfusion, however, we lack therapeutic alternatives with mechanism of actions beyond just prescribing iron and ESAs.

These treatments are logistically complex, particularly in non-dialysis patients and home dialysis patients, leading to another treatment that contrasts with the evidence-based guideline recommendations.

For ESA treatment to be effective, patients must be iron replete and a separate physiological dose of intravenous iron can be required, risking vein viability for dialysis vascular access. The most challenging group of patients are those

FDA CRDAC July 15 2021 39

identified as hyporesponders since they do not achieve target levels of hemoglobin despite high doses of IV iron and ESAs.

The main objective of CKD anemia treatment is to avoid transfusions, yet this remains common across the spectrum of CKD. Transplantation, the therapy with best quality of life, survival, and rehab potential, can be compromised in transfused patients.

Let's discuss our history with anemia treatment and how it has impacted current standard of care. Following the introduction of ESA into clinical practice, the average hemoglobin level in U.S. patients rose because of an increase in the doses of the ESAs. Landmark studies demonstrated an increase in cardiovascular risk related to ESA treatment and led to an FDA boxed warning in 2007 and label update in 2011. The result was lower ESA doses and hemoglobin level declines.

Since this time, the decision of when and how to best treat anemia in CKD is based on guidelines developed by more than 10 organizations,

FDA CRDAC July 15 2021

40

including the global KDIGO, which recommends 1 treatment of anemia in both dialysis and 2 non-dialysis CKD patients to increase hemoglobin to 3 a revised target of 9 to 11.5 grams per deciliter. 4 The consensus of this evidence-based guideline is 5 that the objective of treatment should be to 6 improve patient's quality of life and to reduce the 7 risk of red blood cell transfusions. 8 The cost of achieving the recommended 9 hemoglobin level with last ESA has been an 10 increasing IV iron therapy and supraphysiological 11 12 ferritin levels. Although a goal of treatment is to avoid transfusions, they are still common in 13 14 both non-dialysis and dialysis patients. This figure shows data in older patients not 15 on dialysis. First, know that 39 percent of those 16 patients are not treated at all. We also see not 17 18 only a 40 percent infusion rate but that 19 transfusions are the most common treatment of anemia in this population. 20 21 Transfusion also remains common in the dialysis population, and in 2018, 23 percent of 22

FDA CRDAC July 15 2021

41

patients on dialysis received at least one 1 transfusion. The scenario becomes consequential 2 when we appreciate the impact of transfusions in 3 CKD, especially in those considering a transplant. 4 When I see patients with advanced CKD, the 5 most impactful thing I can do is to help them get a 6 kidney transplant. Transfusion results in 7 clinically significant increases in antibody 8 9 production, with a negative impact in transplant outcomes. 10 First, an increase in the panel reactive 11 antibodies, or PRAs, commonly associated with 12 transfusions delays the perspective of patients 13 receiving a kidney transplant. Unfortunately, many 14 transfused patients will never be transplanted 15 since mortality rates are very high in dialysis 16 patients on the wait list. 17 18 Also, as you can see in this graph, 19 sensitized patients are also at high risk of rejection when they receive a kidney transplant. 20 21 failing transplant has catastrophic events from a

patient's perspective, sending many dialysis

22

July 15 2021

patients back to dialysis every year. Highly sensitized patients also represent a burden to the healthcare system, as they require more complex and costly induction and immunosuppressive treatments.

The final unmet need in CKD anemia treatment is that many patients do not properly respond to current therapies. The ESA hyporesponsive patients are often inflamed and show signs of functional iron deficiency. They represent an important challenge to effective management, typically requiring high doses of iron and ESAs. ESA hyporesponsive patients have higher transfusion mortality and hospitalization rates and increase health care costs compared to patients who have an adequate response to ESA therapy.

In summary, my options to care for patients with CKD anemia, or CKD, are clearly insufficient, and sometimes non-existent. Physicians and patients would benefit from an oral therapy for anemia that promotes endogenous erythropoiesis, improves iron utilization, and offers a choice for ESA hyporesponders.

The logistical changes in the non-dialysis setting have compromised iron and ESA delivery due to the time and distance of therapies, caregiver demands, and disease burden that directly contributes to the high transfusion rates currently observed. We need a treatment that addresses the challenges of delivering iron through the intravenous route and in high doses; one that optimizes home treatments and enables continuous therapy across a transition from the non-dialysis to the dialysis stages of disease treatment. Finally, we need a therapy that improves access to transplant by lowering the risk of transfusions. Thank you for your time and consideration. I will now turn the presentation over to Dr. Szczech. Applicant Presentation - Lynda Szczech DR. SZCZECH: Thank you, and good morning. I am Linda Szczech, vice president of clinical development and medical affairs at FibroGen, and a nephrologist. I am pleased to be here today to present our clinical results showing that

July 15 2021

roxadustat increases hemoglobin in patients with chronic kidney disease and anemia. I will also present data that demonstrate the efficacy of roxadustat independent of baseline iron status or inflammatory state.

We've conducted an extensive clinical development program in chronic kidney disease.

I'll focus my presentation on the results from our six pivotal phase 3 studies, three in patients who are not on dialysis and three in patients who were on dialysis.

The prespecified primary efficacy endpoints were met in each individual study. To facilitate the presentation, I'll present the pooled results, as the results of the individual studies were similar in direction and magnitude. Remember, individual studies were controlled for multiplicity and this was not employed in the pooled analysis.

I'll begin with Study 001, 060, and 608 that enrolled NDD patients. These three trials were similarly designed as global, randomized, double-blind, placebo-controlled studies. Eligible

July 15 2021

patients had baseline hemoglobin levels of less than 10 grams per deciliter. Two of the studies were randomized 2 to 1 roxadustat to placebo and the third was randomized 1 to 1. Treatment durations ranged from 1 to 4 years.

The primary endpoint across all three pivotal NDD studies was the mean change from baseline in hemoglobin averaged over weeks 28 to 52 regardless of rescue therapy. Several secondary and non-hemoglobin related endpoints supported the primary analysis. Today, I will focus on the clinically meaningful endpoints listed here. Other secondary endpoints can be found in your briefing document.

More than 4,000 patients were enrolled in the three pivotal NDD studies, nearly 2400 to roxadustat and 1900 to placebo. Eighty-three percent of roxadustat-treated patients and 71 percent of placebo-treated patients have data to allow the assessment of the primary efficacy endpoint. Information on the proportion of patients completing treatment with full follow-up

July 15 2021

on safety will be presented later during the safety presentation.

At baseline, patients were similar between groups and representative of NDD patients globally. The majority were white followed by Asian. In the U.S., 32 percent of enrolled patients were black or African-American. Our NDD study population had an advanced stage of CKD.

Overall, the median eGFR was about

17 milliliters per minute, with 20 percent of
patients having a baseline eGFR of less than 10.

This is noteworthy for two reasons. First, most
prior phase 3 studies of marketed anemia products
for this population excluded patients with baseline
values of less than 15; and second, the median eGFR
for patients at the time of dialysis initiation in
the U.S., according to the 2020 USRDS annual data
report, was 9.2 milliliters per minute.

Additionally, the mean CRP was greater than
7. For context, the mean CRP in the general
population, as reported by the U.S. NHANES study,
was 0.02. Finally, roughly 40 percent of patients

FDA CRDAC July 15 2021 47

were iron deplete at baseline.

Now let's turn to the primary efficacy endpoint results. In the individual trials, roxadustat met the prespecified primary endpoint. Patients treated with roxadustat experienced statistically and clinically significant improvements in mean hemoglobin regardless of rescue therapy compared to placebo.

This graph shows the change in hemoglobin over 52 weeks with a treatment difference of 1.7 grams per deciliter favoring roxadustat. We will present further results on changes to the treatment algorithm and its effect on the shape of this curve later in the presentation.

This forest plot illustrates the placebo-adjusted treatment effect for roxadustat within the individual studies. The treatment effect for each of these studies was statistically significant compared to the placebo. This significant treatment effect favored roxadustat over a wide range of subgroups.

You'll notice a clear trend that those with

1

20

21

22

July 15 2021

48

the lowest baseline eGFR had the greatest change in hemoglobin from baseline. This is because patients with the lowest eGFR at baseline also had the lowest hemoglobin levels at baseline. Importantly, we saw that irrespective of baseline iron repletion status, patients on roxadustat have the same significant hemoglobin response. The comparable efficacy between roxadustat-treated patients who were iron replete, and those who are iron deplete, was observed without differences in roxadustat doses or a greater need for rescue therapy with IV iron or transfusion. Significantly fewer roxadustat-treated patients required rescue therapy or red cell transfusion compared with placebo-treated patients. Rescue therapy, on the left, included both red cell transfusion, ESA use, or IV iron. Of importance, only 2 percent of patients in the roxadustat arm received IV iron in the first 52 weeks. Shown on the right, roxadustat treatment also reduced the incidence of transfusions compared

July 15 2021

to placebo. Considering the importance of transfusion avoidance that Dr. Pecoits discussed as an unmet need, roxadustat decreased the risk of patients requiring transfusion by 74 percent.

Finally, with respect to the NDD pooled trial, I will highlight the ability of roxadustat to treat anemia during the dialysis initiation period. Please note that patients enrolled in the NDD studies continued treatment, even if their underlying kidney disease required them to start dialysis.

Here we show hemoglobin levels for NDD patients who are receiving roxadustat when they transitioned to dialysis during the study. In this graph, time zero is dialysis initiation. It shows hemoglobin levels in the few months before and after the transition from NDD to begin dialysis. Roxadustat provided stable hemoglobin levels during this very challenging time in a patient's life.

Overall, roxadustat consistently corrected and maintained hemoglobin in NDD patients with anemia CKD. Statistically significant treatment

July 15 2021

50

differences favored roxadustat compared to placebo. 1 Hemoglobin was increased regardless of baseline 2 iron replication status and clinically meaningful 3 reductions in red cell transfusions were achieved. 4 Next, I'll present our three pivotal phase 3 5 studies in dialysis-dependent patients, 6 Studies 001, 063, and 064. These were randomized, 7 open-label trials. The FDA requested we pool these 8 studies because roxadustat was compared to a single 9 comparator, epoetin alfa. Please note that these 10 studies included ESA-naïve patients and those 11 converted to roxadustat from ESA treatment. 12 The primary endpoint was similar to the NDD 13 14 trials. Mean change from baseline in hemoglobin averaged over weeks 28 to 52 regardless of rescue 15 The secondary endpoints focused on therapy. 16 hemoglobin change based on inflammatory status 17 18 because of the historical underperformance of 19 epoetin alfa in patients who are inflamed. I'11 focus on the endpoints listed here. 20 21 We randomized almost 4,000 patients to roxadustat or epoetin alfa; 79.4 percent of the 22

FDA CRDAC July 15 2021 51

roxadustat and 85.1 percent of the epoetin alfa group have data to allow the assessment of the primary endpoint. Baseline demographics and characteristics were similar between the groups and representative of the patients who require dialysis globally. Eighteen percent of patients identified as black globally. Among U.S. patients, 39 percent were African American.

The mean CRP at baseline was similar between the groups and elevated in the same manner as seen in patients with NDD. Of note, serum ferritin levels were approximately 600 in the global cohort. This is roughly twice that of normal, which is usually 100 to 300.

Elevated ferritin levels are common in U.S. dialysis patients. The DOPPS Clinical Practice

Monitor of August 2020 reported that the mean ferritin level in the U.S. was greater than 800.

These markedly elevated levels of ferritin in the DD population suggest impaired iron utilization, also called functional iron deficiency. We will discuss this in detail later.

July 15 2021

Now let's look at the results. In the pooled DD analysis, roxadustat was comparable to epoetin alfa in the mean change in hemoglobin from baseline averaged over weeks 28 to 52. This graph shows the change in hemoglobin with a treatment difference of 0.26 grams per deciliter favoring roxadustat.

Please recall that the DD population comprised patients whose anemia was being corrected in patients who were converting from ESA to roxadustat. This is reflected in the absolute change in hemoglobin from baseline. Based on the hemoglobin change, roxadustat met its primary endpoint of noninferiority across all DD studies. The treatment effect favored roxadustat compared to epoetin alfa.

Based on phase 2 data that showed that roxadustat-treated patients have the same hemoglobin response and maintenance of iron stores, whether they were treated with oral or IV iron, we evaluated the mean monthly IV iron use in our phase 3 program.

FDA CRDAC July 15 2021 53

In the phase 3 studies, oral iron was encouraged and IV iron supplementation was permitted if the patient had an inadequate response to oral iron or couldn't tolerate it, and the patient was iron deficient, as determined by a ferritin of less than 100 or a TSAT of less than 20.

Shown here is the mean monthly IV iron use from week 1 through the first year on treatment.

The endpoint compared IV iron use between weeks 28 to 52, and during that period, roxadustat-treated patients required less monthly IV iron use than patients receiving epoetin alfa.

Additionally, fewer patients in the roxadustat group required red cell transfusion compared to the epoetin alfa group. These results demonstrate that roxadustat is at least as efficacious as epoetin alfa and are clinically meaningful to our patients.

Finally, I will review the results from approximately 400 peritoneal dialysis patients who participated in the global trials. As compared to

July 15 2021

54

epoetin alfa, roxadustat provided a similar treatment difference among patients on peritoneal dialysis in the primary endpoint of change from baseline in hemoglobin. Additionally, as shown on the right graph, patients who received roxadustat required fewer red cell transfusions during the treatment period than those who received epoetin alfa. Next, I'll further discuss roxadustat efficacy in patients with inflammation. The effect of inflammation on erythropoiesis and anemia treatment is complicated. It is important to emphasize that hepcidin is a key negative regulator of iron homeostasis that increases with inflammation and results in iron sequestration or trapping, which can conceptually be referred to as functional iron deficiency. In patients receiving dialysis, this inflammation as subsequent iron trapping leads to increased IV iron use to attempt to overcome the

functional iron deficiency and results in even

higher ferritin levels. Therefore, inflammation,

July 15 2021

whether measured by elevated CRP or hepcidin, causes unique problems in the treatment of anemia of CKD.

I will now present data demonstrating how roxadustat mobilizes iron and benefits patients on dialysis. Hyporesponsiveness, as mentioned by Dr. Pecoits, is an important problem with ESA therapy mediated through inflammation and lack of iron availability to the bone marrow. CRP as a marker of inflammation is elevated among patients who are less responsive to ESAs due to inflammation.

While there is no single or standard definition of hyporesponsiveness, arguably, many definitions are population-specific, examining patients who are less responsive than the rest of the population. Therefore, it may be clinically relevant to look at the spectrum of responsiveness within a population to best understand the relationships with treatment.

To explore the efficacy of roxadustat across the spectrum of inflammation, we first evaluated

levels of baseline CRP.

July 15 2021

hemoglobin response relative to baseline levels of CRP collected in 4 of the 6 pivotal trials. As we look at increasing baseline quintiles of CRP from left to right, roxadustat treatment results in an equally robust increase in hemoglobin compared with epoetin alfa.

It is important to examine the dosing requirements now to complete this picture. Here, we see an important difference in dosing between the two treatments. In yellow, epoetin alfa-treated patients required progressively higher doses to maintain hemoglobin response at higher

The weekly doses of epoetin alfa rose from 112, among patients with the lowest degree of inflammation, to 139 units per kilogram in patients with the highest degree, a 24 percent increase.

Conversely, roxadustat dosing requirements, in blue, did not increase at higher levels of CRP.

Next, we explored how a reduction in hepcidin may affect the sequestration of iron seen in inflammation and functional iron deficiency and

July 15 2021

57

may be of a more direct benefit to patients. 1 will begin with a broad overview of how roxadustat 2 affects iron stores consistent in both NDD and DD 3 patients, and we'll look at NDD patients first. 4 Hepcidin, on the right, is significantly 5 decreased with roxadustat treatment and is 6 associated with increased serum iron levels and 7 decreased ferritin. Please note that this increase 8 in serum iron occurred with roxadustat therapy 9 concurrent with less IV iron use -- only 2 percent 10 received IV iron in the first 52 weeks -- and even 11 those significant amounts of endogenous iron were 12 being used to produce hemoglobin. 13 While the fact that one marker of iron 14 stores is increasing, serum iron, while another 15 marker is decreasing, ferritin, may seem to be a 16 paradox, the most important thing to remember here 17 18 is that ferritin is a marker of intracellular iron 19 stores. The decline in ferritin in roxadustat-treated patients as compared to 20 21 placebo-treated patients is consistent with a reduction in hepcidin that leads to the 22

July 15 2021

mobilization of trapped intracellular iron stores and their subsequent delivery to the bone marrow.

The iron results in the DD population were similar and provide us the opportunity to compare roxadustat to epoetin alfa. In the DD trials, roxadustat increased serum iron in patients while allowing for less IV iron administration, lower transfusion rates, and slightly higher hemoglobin levels. Conversely, serum iron decreased in patients who received epoetin alfa.

Although hepcidin and ferritin were reduced in both treatment arms, the greatest reduction occurred in the roxadustat-treated patients. As in the NDD-treated patients, the increased iron and decreased ferritin with roxadustat treatment suggest an increased iron mobilization from previously trapped stores. This represents a unique physiologic difference between roxadustat and epoetin alfa. Now let's look at how it's clinically relevant to patient outcomes.

A high serum ferritin or hepcidin level could be a marker of inflammation or iron

sequestration, which contribute to hyporesponsiveness to ESA treatment. We therefore examined the efficacy of roxadustat, on the right, and epoetin alfa, on the left, according to baseline quintiles of these values, and serum ferritin is presented in this slide. As a reminder, the normal range for ferritin is roughly 100 to 300. The mean serum ferritin at baseline was approximately 600, almost twice that of normal, with the highest quintile, 20 percent of the treatment arm, having values higher than 1000. In a clinical setting, high ferritin values often lead to significant doses of IV iron to attempt to overcome the inflammation-induced functional iron deficiency so that hemoglobin can be effectively produced.

Among patients treated with epoetin alfa, on the left, those with the highest ferritin levels, in red and orange, had the lowest hemoglobin levels. This lower hemoglobin response occurred despite patients receiving higher epoetin alfa doses. The mean difference between quintiles,

July 15 2021

between the red and orange, and the other three quintiles was as high as 0.5 grams per deciliter at some points. In contrast, roxadustat-treated patients, on the right, had similar increases in hemoglobin across all baseline ferritin quintiles.

To explore the clinical relevance of these observations, I will discuss the differences in transfusion rate between roxadustat-treated and epoetin alfa-treated patients, focusing on the subset of patients with functional iron deficiency due to inflammation identified here.

In this exploratory analysis of patients based on baseline ferritin levels, roxadustat-treated patients received transfusions less frequently than epoetin alfa-treated patients in all quintiles. In the epoetin alfa arm, in yellow, when comparing the highest quintile of ferritin, on the right, to the lower four quintiles combined, on the left, the incidence of transfusion is highest in the highest quintile of ferritin, likely reflective of the lower hemoglobins achieved in this highest quintile, relative to the rest of

FDA CRDAC July 15 2021 61

the epoetin alfa arm.

In short, epoetin alfa-treated patients had the highest baseline serum ferritin levels,

20 percent of the cohort; so in those patients they had both the lowest hemoglobin levels and the highest rate of transfusion in both treatment arms.

The same relationship of underperformance of epoetin alfa is seen when hemoglobin levels are compared among quintiles of hepcidin, also potentially reflective of a group with functional iron deficiency, and these analyses are described in the briefing book.

In summary, the DD clinical trials show that roxadustat was comparable to epoetin alfa regardless of baseline inflammation.

Roxadustat-treated patients achieved clinically meaningful reductions in red cell transfusions and IV iron use, particularly in patients with markers of iron stores suggesting functional iron deficiency. Overall, the roxadustat clinical program provided consistent efficacy. Roxadustat increased hemoglobin and managed anemia across the

FDA CRDAC July 15 2021 62

continuum of CKD. 1 Thank you. I'll now turn the presentation 2 over to Dr. Little, who will present the safety of 3 roxadustat. 4 Applicant Presentation - Dustin Little 5 DR. LITTLE: Thank you, Dr. Szczech. 6 I'm Dustin Little. I'm a nephrologist, and 7 I'm the roxadustat global clinical head at 8 AstraZeneca, and I'll be presenting the safety 9 results from our clinical program. 10 Today, I will be discussing the pooled 11 cardiovascular safety results for our pivotal 12 phase 3 program, a review of specific events from 13 14 the program, and a summary of our risk management plan. Let's start with some history of how the 15 roxadustat program came to be. 16 The program was initially intended to 17 18 consist of pivotal efficacy trials without a pooled 19 assessment of cardiovascular safety. Based on FDA feedback to study cardiovascular safety, a 20 21 meta-analysis of pivotal phase 3 trials was planned, and Studies 001 and 002 were added to the

22

FDA CRDAC July 19

July 15 2021

program.

Key endpoints include MACE, or major adverse cardiovascular events, and MACE-Plus. MACE consisted of all-cause mortality, myocardial infarction, and stroke, and MACE-Plus is defined as MACE plus hospitalization for heart failure or hospitalization for unstable angina. The use of all-cause mortality in the cardiovascular safety composites is consistent with precedent from prior CKD anemia cardiovascular trials and was suggested by FDA.

The aim of our program was to generate a sufficient safety database to assess the cardiovascular safety of roxadustat compared to placebo in non-dialysis-dependent CKD and compared to epoetin alfa in dialysis-dependent CKD. The roxadustat program is the largest phase 3 CKD anemia program ever conducted. In the placebo-controlled NDD population, we studied 4,270 patients, 830 of whom had a major adverse cardiovascular event during the study. Due to the placebo-controlled design, we observed differences

July 15 2021

in treatment discontinuation, which I will tell you more about on the subsequent slides.

In the epoetin alfa-controlled DD program, we studied 3,880 patients, 645 of whom had a major adverse cardiovascular event during the treatment period. In the DD population, treatment discontinuation was more balanced by treatment group compared to NDD.

Reported cardiovascular events were sent to a blinded central independent event review committee for adjudication, and the program is monitored by an independent data monitoring committee. The size of the program allowed for the use of a noninferiority margin of 1.3 based on precedence and an FDA guidance on the evaluation of cardiovascular safety for new drugs, which was active at the time of the design of the roxadustat program.

Let's first focus on cardiovascular safety in the NDD population. As shown earlier, baseline characteristics were well balanced between treatment groups. More roxadustat patients

65

completed treatment compared to placebo patients at 62 percent and 40 percent, respectively. result of this, the mean treatment duration for roxadustat patients was 1.6 years compared to 1.2 years for placebo. Where possible, patients were followed for cardiovascular events after treatment discontinuation, and 88 percent of roxadustat and 85 percent of placebo-treated patients were assessed for MACE through the end of the study. Vital status, whether a patient is alive or dead, could be confirmed via public record search at the end of the study for some patients, and 91 percent of patients in both treatment groups had complete follow-up for all-cause mortality.

Before we discuss the results of the cardiovascular safety analyses of the program, I'd like to take a few slides to discuss the impact of these differences in treatment discontinuation.

This curve shows the proportion of patients remaining on treatment over time by treatment group. As you can see, the maximum treatment

FDA CRDAC July 15 2021 66

duration was more than 3 years.

Large differences in treatment
discontinuation were noted early in the study. For
example, 20 percent of placebo patients
discontinued treatment in the first approximately
4 months following randomization compared to nearly
9 months for roxadustat. This pattern was also
noted in time to discontinuation of treatment in
50 percent of patients by treatment group, which
occurred approximately 6 months later in the
roxadustat group.

As a result of these differences in treatment discontinuation, roxadustat-treated patients had substantially more exposure to study treatment compared to placebo patients. To investigate whether the types of patients who stopped treatment are different for the two treatment groups, which would lead to bias in on-treatment analyses, we evaluated the characteristics of patients remaining on roxadustat over time compared to placebo.

This figure shows the median baseline

FDA CRDAC July 15 2021

estimated glomerular filtration rate at different time points following randomization for patients remaining on roxadustat and placebo treatment.

Median eGFR was balanced at baseline, however, because patients with more severe CKD tend to have more severe anemia, placebo patients with lower baseline eGFR were more likely to require anemia rescue therapy and stop treatment compared to placebo patients with less severe CKD.

As a result of this, the population of patients remaining on placebo progressively became a population of patients with less severe baseline CKD. By contrast, roxadustat patients' anemia was effectively managed, resulting in patients with more advanced CKD being able to continue with longterm treatment.

This curve shows the proportion of patients remaining on treatment following dialysis initiation by treatment group. When including patients who started dialysis after treatment discontinuation, a similar proportion of patients required dialysis initiation overall. However,

July 15 2021

more patients started dialysis while on roxadustat treatment because placebo patients who were close to dialysis were more likely to stop placebo treatment due to low hemoglobin values and requirement for treatment of anemia; and because most dialysis patients require anemia treatment, placebo patients discontinued study drug at very high rates following dialysis initiation.

Due to these differences in treatment discontinuation, both prior to and following dialysis initiation, more patients starting dialysis were able to continue roxadustat therapy.

This slide shows the percentage of dialysis patients among patients remaining on treatment over time. For example, at 12 months following randomization, approximately 20 percent of patients remaining on roxadustat have started chronic dialysis compared to approximately 10 percent of placebo patients, and the magnitude of this difference increased over time. This is clinically important because patients starting dialysis have substantially higher risk of cardiovascular events

July 15 2021

69

and other events compared to non-dialysis patients. 1 Although this complicates the interpretation 2 of NDD CV safety data, it is important to note that 3 we have a dedicated analysis of the cardiovascular 4 safety of roxadustat compared to epoetin alfa in 5 over 1,500 incident or new-to-dialysis patients, 6 7 which I will present later. This slide shows mortality rates by NDD CKD 8 stage and by month following dialysis initiation in 9 U.S. patients. As you can see, mortality risk 10 increases as NDD CKD becomes more severe and 11 12 increases markedly with dialysis initiation. On the prior slides, I've shown you that 13 14 patients with more severe CKD and those requiring dialysis initiation were overrepresented in the 15 roxadustat group over time due to differences in 16 treatment discontinuation. Because these patients 17 18 have higher cardiovascular risk, this means that 19 the balanced CV risk that was present at baseline due to randomization was not preserved among 20 21 patients remaining on treatment. Thus, 22 on-treatment analyses will be heavily biased

July 15 2021

against roxadustat.

So with that background, let's discuss how we can analyze the roxadustat NDD cardiovascular safety data. The ideal analysis would ensure that the effect of randomization in terms of equal risk by treatment group is preserved. This is not the case for on-treatment analyses due to differences in treatment discontinuation.

In an ideal analysis, missing data and time off treatment should be minimized and there should be an adequate number of patients with events. ITT or on-study analyses include all events which occur following randomization, including those which occur after treatment discontinuation.

This has the advantage of balancing patient risk throughout the analysis period. However, in the roxadustat program, ITT on-study analyses have some missing data, with more missing data in the placebo group, and they include a substantial proportion of time off treatment, particularly among placebo patients.

In the roxadustat NDD program, no single

FDA CRDAC July 15 2021

analysis achieves all of these objectives in an ideal manner. However, different analyses have different strengths and weaknesses and can be used collectively to assess the cardiovascular safety of roxadustat.

This slide shows several analyses which have been performed comparing MACE risk for roxadustat to placebo. I'd like to point out that the hazard ratio and 95 percent confidence intervals cross 1 for all of the analyses except for the on-treatment analysis.

We've already discussed how the on-treatment analysis is profoundly affected by differences in treatment discontinuation and how the ITT on-study analysis is limited by greater missing data and greater time on treatment in the placebo group.

Overall, analyses which preserve the benefit of ITT analysis in terms of equal risk by treatment group, but which minimize the impact of missing data and greater time off treatment in the placebo group, have hazard ratio point estimates of close to 1.0, supporting that risk for MACE is comparable

FDA CRDAC July 15 2021

for roxadustat compared to placebo.

These analyses include ITT on-study analyses of patients with baseline eGFR of greater than or equal to 10 milliliters per minute, which excludes the quintile of patients with the lowest baseline eGFR who were most affected by differential treatment discontinuation.

We also performed ITT on-study analysis with censoring at dialysis initiation in order to focus on the cardiovascular safety of roxadustat in non-dialysis patients, and we also performed ITT on-study analysis with censoring at one year following randomization because that is a time frame at which differences in treatment discontinuation were of a lower magnitude.

Additionally, the hazard ratio point estimate for the 992 patients from the United States who were more representative of U.S. non-dialysis patients was 0.99.

In contrast to the NDD placebo-controlled data, Study 610 is an active comparator NDD study not affected by large differences in treatment

FDA CRDAC July 15 2021

discontinuation. The MACE hazard ratio point estimate for roxadustat compared to darbepoetin alfa was 0.81. These results are supportive of the cardiovascular safety of roxadustat in non-dialysis patients.

Coming back to the placebo-controlled NDD program, here are the Kaplan-Meier curves from MACE risk over time for roxadustat compared to placebo.

On the left is the overall ITT or on-study analysis, and on the right is the analysis with censoring at dialysis initiation.

The latter analysis is, as mentioned previously, performed in order to focus on roxadustat's cardiovascular safety in non-dialysis patients and is less affected by missing data and greater time on treatment in the placebo group. In both figures, the curves track closely together, consistent with comparable MACE risk for roxadustat and placebo.

This figure shows the results of MACE-Plus cardiovascular mortality and each of the components of MACE-Plus. For each event, two results are

July 15 2021

shown, overall NDD, which is on top, and NDD with censoring at dialysis initiation, which is also known as NDD-NDD. For each event, the 95 percent confidence interval crossed 1.0.

Let's turn now to the DD population. As shown earlier, baseline characteristics were well balanced between the treatment groups. Fifty-eight percent of roxadustat compared to 66 percent of epoetin alfa patients completed treatment.

When interpreting these data regarding the proportion of patients completing treatment, it is important to remember that these were event-driven studies with a maximum treatment duration of more than three years. A similar proportion of patients were followed for MACE events through the end of the study and a similar proportion of patients in both treatment groups had complete follow-up for all-cause mortality.

As mentioned previously, the DD population included patients untreated with ESA at baseline as well as patients on ESA treatment prior to enrollment. As described earlier and consistent

FDA CRDAC July 15 2021

with nephrology convention, incident dialysis
patients were predefined as patients who were
randomized to roxadustat or epoetin alfa within
4 months following dialysis initiation. Incident
dialysis patients were generally not on anemia
treatment at baseline or had been recently
initiated on treatment prior to enrollment.

In contrast to the incident dialysis
subgroup, stable or prevalent dialysis patients
were mostly on long-term ESA treatment at baseline.
Thus, patients randomized to roxadustat required
conversion to a different mechanism of anemia
treatment, whereas ESAs patients continued ESA.

Following completion of study treatment, roxadustat patients would be expected to convert to ESA particularly within the first 4 weeks following the conclusion of treatment, whereas ESA patients would be expected to continue treatment with ESA.

Here are the results of the on-treatment plus 7-days analysis set for the pooled DD assessment of MACE for roxadustat compared to epoetin alfa. This analysis window was the

FDA CRDAC July 15 2021

agreed-upon primary analysis set with FDA. The analysis shows similar cardiovascular risk for roxadustat compared to epoetin alfa, with a hazard ratio point estimate of 1.02 and 95 percent confidence interval upper bound of 1.20.

Results in the predefined subgroup of incident dialysis are shown. The incident- or new-to-dialysis population is considered to be particularly relevant for three reasons.

First, anemia treatment is often initiated during the incident dialysis period. Second, incident or new-to-dialysis patients are exposed to substantial cardiovascular risk, and it was important for us to ensure that we had no cardiovascular safety signal in this traditionally high-risk population.

And third, patients starting dialysis in our NDD program were those who were most substantially affected by differences in treatment discontinuation; so analysis of the incident dialysis subgroup of the overall dialysis population is required to fully understand

July 15 2021

roxadustat's cardiovascular safety in patients recently initiated on dialysis.

Results in the stable dialysis subgroup of patients who were randomized to either continue ESA or convert to roxadustat are also shown. Finally, the on-treatment plus 28-days analysis set is shown as a support of analysis. Overall, the results are consistent with comparable risk for MACE for roxadustat and epoetin alfa.

Here's the Kaplan-Meier curve for MACE for the DD population. The curve tracked closely together consistent with similar MACE risk for roxadustat and epoetin alfa. The hazard ratio for MACE-Plus for roxadustat compared to epoetin alfa was 0.91. Looking at each component of MACE-Plus, risk was similar for roxadustat and epoetin alfa.

Study 613 was an outlier in the DD program and was not pooled with the pivotal DD studies because of its unique design with two ESA comparators. It was a study of exclusively stable dialysis patients and contained no incident dialysis patients. Patients' short-acting ESA at

22

July 15 2021

78

baseline were randomized to either roxadustat or epoetin alfa, whereas patients on long-acting ESA were randomized to either roxadustat or darbepoetin alfa. All patients were from Europe, with 79 percent from Eastern or Central Europe. another difference between 613 and the pivotal DD trials is that starting roxadustat doses were higher in Study 613. Study 613 was not powered for the assessment of cardiovascular safety, therefore it is instructive to consider the impact of adding Study 613 to the DD pool. Although 613 was an outlier in terms of the design and the cardiovascular safety results, when pooled with the pivotal dialysis studies, the overall conclusion of comparable MACE risk for roxadustat and epoetin alfa is unchanged, as the hazard ratio point estimate was 1.08 with 95 percent confidence interval upper bound of 1.24. Before I summarize the cardiovascular safety data in the roxadustat program, I'd like to point

higher targets.

FDA CRDAC July 15 2021 79

out that in our program, we did not compare roxadustat to ESA dose according to the trials that demonstrated increased cardiovascular risk, but rather dosed according to current labels, which have been updated to minimize cardiovascular risk.

As you know, the normal hematocrit in CHOIR trials compared ESA dose to two different hemoglobin targets and increased cardiovascular events were noted in the groups randomized to the

Importantly, the hemoglobin targets used in patients treated with ESA in the roxadustat program were more consistent with the control groups in normal hematocrit in CHOIR, and it is in this setting that we had MACE, MACE-Plus, and all-cause mortality hazard ratios ranging from 0.91 to 1.02 in the DD pool and of less than 1 in Study 610.

In conclusion, roxadustat's cardiovascular safety has been evaluated across the continuum of patients with CKD anemia. In the non-dialysis-dependent population, the risk of MACE was comparable to placebo and there was no

July 15 2021

increased cardiovascular risk noted for roxadustat compared to darbepoetin alfa in the 610 trial, which was not affected by substantial differences in treatment discontinuation.

In the overall DD population, patients receiving roxadustat had comparable risk of MACE compared with the epoetin alfa, and similarly in the incident- or new-to-dialysis and the stable dialysis subgroups, MACE risk was comparable between the treatment groups.

Next, I'll review data on the following safety topics where imbalances were noted: seizures, infections, vascular access thrombosis, and deep vein thrombosis.

Labels for approved ESAs warned about seizures, which have been observed with ESA therapy. We performed a standard metric query for convulsions to capture all adverse events potentially referring to seizures. We noted that more roxadustat patients had seizure events versus the comparators. Although the number of patients with a reported baseline history of seizure was low

FDA CRDAC July 15 2021 81

in the roxadustat program, these patients disproportionally contributed to the imbalance, and we consider that patients with a history of seizure should be treated with roxadustat with caution.

Patients with severe CKD are at high risk for infection, and infection is among the leading causes of death in dialysis patients. In the NDD program, patients at highest risk for infection were more likely to discontinue placebo compared to roxadustat; therefore, differences in treatment discontinuation likely contributed to the observed imbalances in serious and fatal infection compared to placebo, particularly in on-treatment analysis as is shown here.

By contrast, in the DD program where treatment discontinuation was more balanced, the incidence of serious and fatal infection was similar between treatment groups.

This table shows all infection serious adverse events in the NDD population with an incidence of at least 1 percent in either treatment group. These adverse events are consistent with

July 15 2021

the most common events expected in a population of patients with severe chronic kidney disease. As may be expected, considering the differences in treatment discontinuation described previously, the incidence of these infections were higher in the roxadustat group. By contrast, the incidence of the most common infection SAEs in the DD program were generally similar for roxadustat and epoetin alfa.

To summarize our infection data, we saw imbalances in serious and fatal infection in the placebo-controlled NDD program but not the active control DD program. Because ESAs aren't known to cause serious or fatal infections in CKD anemia, these results suggest that the results in the NDD program may be related to bias due to differential treatment discontinuation.

ESAs have been observed to increase thrombosis risk, particularly when treating to higher hemoglobin targets. What is reported here is an overall composite of thrombosis events, which include vascular access thrombosis, venous events

FDA CRDAC July 15 2021 83

such as deep vein thrombosis, and arterial events such as myocardial infarction. In the NDD and DD populations, the types of thrombosis reported were typical of those observed in the CKD population with no imbalances observed in rare or atypical thrombotic events.

Overall, the rates of potential arterial thrombosis events were similar between roxadustat and comparator as demonstrated by the results of adjudicated myocardial infarction and stroke.

However, for both the NDD and DD populations, there were more vascular access thrombosis and deep vein thrombosis events in roxadustat-treated patients.

Weights of deep vein thrombosis pulmonary embolism were higher for roxadustat compared to placebo in non-dialysis patients. In the DD program, the incidence of pulmonary embolism, or PE, and the overall incidence of DVT and PE was similar for roxadustat compared to epoetin alfa. However, the incidence of DVT was higher at 1.5 percent for roxadustat compared to 1 percent for epoetin alfa.

July 15 2021

Vascular access thrombosis is a known risk of treatment of CKD anemia. Here, the term "vascular access thrombosis," or VAT, refers to thrombosis of an arteriovenous fistula or arteriovenous graft that is used, or planned to be used, for hemodialysis vascular access. Potential vascular access thrombosis events were centrally adjudicated by a committee which was blinded to treatment assignment, and the incidence of adjudicated VAT is what is shown here.

VAT events occurred more frequently in roxadustat-treated patients in the NDD and DD populations. The DD data is the focus of our VAT evaluation because NDD patients would not be expected to have dialysis access at baseline and because NDD patients requiring dialysis access were those who were most affected by differential treatment discontinuation. Among dialysis patients overall, VAT was noted in 13 percent of roxadustat compared to 10.5 percent of epoetin alfa patients.

Part of our investigation of our thrombosis data included an evaluation of the rates of

FDA CRDAC July 15 2021 85

thrombosis over time. We found that rates of thrombosis and VAT with roxadustat were highest during the initial treatment period and decreased over time, and the differences in rates for roxadustat compared to epoetin alfa were also highest during the early treatment period.

This corresponds with the time frame when differences in mean hemoglobin values were largest for roxadustat compared to epoetin alfa and when rapid rates of hemoglobin rise were most common for patients treated with roxadustat.

This figure shows rates of thrombosis and vascular access thrombosis by hemoglobin rate of rise using analytic methods agreed to between FDA and the sponsor. In both roxadustat- and epoetin alfa-treated patients, higher rates of thrombosis were observed at higher rates of rise of hemoglobin.

Notably, rapid rate of rise of hemoglobin was observed more frequently with roxadustat treatment. These results, taken together with the results on the previous slide, support that

FDA CRDAC July 15 2021 86

thrombosis and vascular access thrombosis risks are associated with rapid rate of hemoglobin rise with roxadustat treatment.

We also evaluated the possibility of a relationship between dose and thrombosis risk, and noted that rates of thrombosis and VAT appeared to be higher at higher doses of roxadustat. Although these data have limitations and do not conclusively demonstrate that higher roxadustat doses are causative of thrombosis, we considered whether roxadustat doses could be lowered by targeting a lower hemoglobin value.

But before we discuss roxadustat dosing, I'd like to review the results of these analyses in NDD patients. In NDD patients, rates of thrombosis AEs were higher at higher rates of hemoglobin rise. We also noted in NDD that rates of thrombosis tended to be higher at higher roxadustat doses.

In light of these findings, we are proposing changes to roxadustat dosing to mitigate thrombosis risk. First, we plan to lower the hemoglobin target from 10.5 to 12 grams per deciliter to 10 to

FDA CRDAC July 15 2021

11 grams per deciliter. As I will show you, this allows for us to use lower roxadustat doses throughout the treatment period and it also allows us to minimize hemoglobin overshoots with roxadustat treatment. Additionally, we plan to lower roxadustat starting doses both in ESA untreated and ESA conversion patients. In subsequent slides, I will show you the expected impact of these changes on the incidence of rapid hemoglobin rise.

Finally, we recommend that patients who are unresponsive to roxadustat receive no more than three consecutive increases in roxadustat dose. As above, based on the results from our clinical program, we discussed with FDA to target hemoglobin values of 10 to 11 grams per deciliter, and we knew that lowering starting doses would lower the rate of hemoglobin rise and the incidence of early hemoglobin overshoots.

We used modeling and simulation to help us decide which specific starting doses to propose and to evaluate the expected impact on roxadustat

July 15 2021

dosing of the proposed lower hemoglobin target. To assess the reliability of our simulations, we compared simulated mean hemoglobin values using the phase 3 roxadustat doses to the actual phase 3 hemoglobin values in the clinical program, and as you can see here, the simulation results closely matched the observed clinical results.

The left figure on this slide shows the simulated incidence of rapid rate of hemoglobin rise with the phase 3 doses compared to the proposed lower starting doses. As you can see, the change in starting dose is anticipated to reduce the incidence of rapid rate of hemoglobin rise quite substantially, which is expected to lower risk of thrombosis and specifically vascular access thrombosis.

The figure on the right half of the slide shows simulated mean hemoglobin values over time with the phase 3 compared to the proposed dosing.

As you can see, the proposed dosing is expected to lead to mean hemoglobin values which increase into the target range, with less potential for

July 15 2021

hemoglobin overshoots, particularly during the initial treatment period.

This slide shows similar simulation results for patients converted from ESA. Again, the incidence of rapid rate of hemoglobin rise is substantially lower and mean hemoglobin values are more stable during the initial treatment period with the proposed dosing changes.

This slide shows the simulated mean roxadustat doses with the lower starting doses and the lower hemoglobin target. Overall, this strategy is expected to reduce roxadustat doses by more than 25 percent during the treatment period.

Here, I'm showing you, once again, the incidence of thrombosis by roxadustat dose. Using the phase 3 starting doses and phase 3 target hemoglobin, the average roxadustat dose would be expected to be approximately 3 milligrams per kilogram per week, a dose above which higher rates of thromboses were observed.

By contrast, mean doses using the proposed starting dose and the proposed hemoglobin target

July 15 2021

are expected to be 2.2 milligrams per kilogram per week, which corresponds with doses at which lower thrombosis rates were observed.

Here is the same analysis for DD patients. As you can see, the proposed updated dosing is expected to reduce roxadustat doses by more than 30 percent. This slide shows rates of thrombosis and VAT by roxadustat dose in the DD population.

Once again, predicted mean dose using the phase 3 dosing corresponds with doses that are close to ranges where increased rates of thromboses were noted, whereas predicted mean dose using the proposed dosing corresponds with doses at which observed thrombosis rates were lower.

In terms of risk management, in addition to the changes to dosing, we plan to communicate all important safety information and recommendations for risk mitigation associated with the use of roxadustat in the prescribing information for healthcare providers and a medication guide for patients, and we also plan to communicate risks and educational materials for healthcare providers. We

July 15 2021

additionally plan to utilize product labeling to mitigate risk.

In addition to the proposed dosing changes, we will also make recommendations on the appropriate frequency of hemoglobin monitoring and to consider withholding treatment for severe or life-threatening thrombosis and to manage all thromboses promptly.

We consider that patients with a history of seizure should be treated with roxadustat with caution and that patients should promptly report symptoms, new onset seizures, or increase in seizure frequency to their healthcare provider. We also recommend to avoid starting roxadustat in patients with an active severe or serious infection, that patients be monitored for signs and symptoms of infection, and that any infection be promptly treated.

On the slide after this, I will review with you a proposal for a postmarketing study to confirm that vascular access thrombosis risks are similar for roxadustat and ESA with the proposed roxadustat

July 15 2021

dosing regimen, but first, I'd like to point out that the practice model for U.S. dialysis patients is uniquely suited to prospectively evaluate the effectiveness of our risk minimization strategies for lowering VAT risk in the postmarketing setting using real-world evidence.

First of all, there are more than 500,000 prevalent U.S. dialysis patients with more than 100,000 patients starting dialysis each year. This large pool of patients allows us to effectively match patients treated with the standard of care to patients treated with roxadustat.

Additionally, anemia treatment data is collected systematically with hemoglobin values assessed monthly as part of typical clinical practice. Patients dialysis accesses are assessed for the presence of thrombosis in conjunction with every dialysis session and it is noted when patients require new dialysis access following a thrombosis event.

Finally, by studying patients treated with roxadustat in the real world, we can assess a

July 15 2021

broader more generalizable patient population, and we would expect the results to be directly translatable to clinical practice. So with this in mind, we're proposing a post-approval, prospective, matched cohort study of U.S. dialysis patients treated with roxadustat compared to ESA.

Both ESA untreated and conversion patients will be studied. Patients will be treated according to approve labels, and roxadustat-treated patients will be compared to matched ESA-treated patients based on predefined criteria.

The main objectives will be to compare VAT risk for roxadustat and ESA and to assess risk factors for VAT with both treatments. We plan to study 5,000 roxadustat-treated patients compared to 5,000 ESA-treated patients with one year of observation time per patient. With this sample size, we expect approximately 1,000 events, which is expected to allow us to estimate the incidence rate of vascular access thrombosis in each treatment group plus or minus 1 event per 100 patient-years.

July 15 2021

In conclusion, our large database allowed for a comprehensive evaluation of the roxadustat safety profile. We observed comparable cardiovascular risk for roxadustat versus placebo and versus ESA in non-dialysis patients compared to ESA in dialysis patients. Patients treated with roxadustat had an increased incidence of vascular access thrombosis, deep vein thrombosis, and seizures, and we saw a higher incidence of fatal infections versus placebo in NDD patients, but not compared to ESA in DD patients.

We are proposing several strategies to manage these risks. First, product labeling will communicate warnings and precautions to physicians and a medication guide will communicate these risks to patients.

We're also proposing changes to dosing that will decrease the risk of thrombosis with roxadustat treatment, and we're proposing a postmarketing, real-world study of 10,000 patients to confirm that risk of VAT is similar for roxadustat and ESA with the proposed changes to

FDA CRDAC July 15 2021

roxadustat dosing. We will continuously evaluate, communicate, and mitigate risks, and we are committed to working with the FDA to further characterize the roxadustat safety profile in the post-approval setting.

Thank you, and I'll now turn the presentation to Dr. Fishbane.

Applicant Presentation - Steven Fishbane

DR. FISHBANE: Good morning. My name is

Steven Fishbane. I'm a practicing nephrologist and
a professor of medicine of the Donald and Barbara

Zucker School of Medicine at Hofstra/Northwell and
chief of nephrology for the Northwell health
system. I've taken care of patients with kidney
disease and have studied this condition for more
than 25 years. I'm an active member of the KDIGO
global anemia and kidney disease guideline group.

From this vantage point, I'd like to share my perspective on the use of roxadustat for patients with the anemia of CKD. The history here is important. Treatment of anemia is critical in the care of patients with CKD. Forty years ago,

July 15 2021

before ESA therapy was available, hemoglobin levels in patients receiving dialysis were severely depressed. For these patients, life was truly miserable and many were unable to function or even perform basic activities of living.

Blood transfusions were the standard of care. There were many problems associated with repeated blood transfusions in addition to cost, patient inconvenience, and infections; but more importantly, the development of antibodies that make it difficult to get a kidney transplant and also iron overload, which was almost universal, frequently requiring chelation treatment.

The approval of ESAs in 1989 was an important advance for patients, but there's not been much innovation in anemia treatment since the first ESA approval. I believe roxadustat now represents an important advance.

Despite the breakthrough that ESAs were in dialysis anemia, problems in dialysis anemia treatment remain today in 2021. The first problem relates to patients who are transitioning from CKD

FDA CRDAC July 15 2021

to begin dialysis. These first few months on dialysis are very difficult with sharply increased hospitalizations and mortality risk. Previously untreated anemia greatly complicates this incident dialysis period with rapid hemoglobin fluxes and high ESA doses.

On the left, the first figure from DOPPS shows what current anemia treatment looks like at the start of dialysis. You can see how low hemoglobin levels are, and it takes months to reach a stable hemoglobin concentration.

The second figure on the right is what

Dr. Szczech showed earlier, how roxadustat allows

for a more orderly hemoglobin transition to

dialysis. I have long waited to be able to treat

my office CKD patients for this issue with an oral

agent like roxadustat that would create this kind

of smooth transition to dialysis.

A second issue, once patients are on dialysis, ESA hyporesponsiveness is a frequent concern. A poor ESA hemoglobin response leads to transfusions, high ESA doses, and an associated

July 15 2021

increased risk of cardiovascular events. Iron deficiency and inflammation are widely accepted as the major causes of hyporesponsiveness. Both complicate current ESA treatment leading to very high IV iron doses and unresolved anemia of inflammation. Roxadustat meaningfully addresses both of these leading causes of hyporesponsiveness.

We saw from the data how roxadustat improved iron availability and reduced IV iron doses in the figure on the left; and as for inflammation, how it worked well despite elevated CRP without the need for the high doses, as was true for epoetin alfa on the right.

The third issue has to do with home dialysis. The country right now is making a major push to increase home dialysis, but both injected ESA therapy and intravenous iron complicate this effort. In the figure, we saw data Dr. Szczech showed on how remarkably well roxadustat worked in patients on home dialysis PD. It's clear to me that roxadustat can help with each of these current dialysis anemia problems.

July 15 2021

Now, for patients with kidney disease not yet on dialysis, anemia management is currently even more challenging. We made strides in dialysis anemia treatment, but non-dialysis patients have truly been left behind. Up to 50 percent of these patients have anemia, yet most are untreated.

The reason is largely because of the complexities and logistical issues associated with both injected ESAs and intravenous iron and the frequent clinic visits that are required. In fact, data show that less than 15 percent of non-dialysis patients receive ESA therapy, and although two-thirds of non-dialysis patients have iron deficiency, very few receive iron treatment.

As a result, in the U.S. today, if non-dialysis patients are treated for anemia at all, it is likely with a blood transfusion. More patients receive blood transfusions than either ESAs or intravenous iron.

Now this is important. Forty percent of patients receive a blood transfusion in the two years prior to starting dialysis. Transfusions are

July 15 2021

100

highly relevant, as they cause antibody production, and this makes it harder to receive a kidney transplant, clearly the best treatment for ESRD, and for those that receive a transplant, the risk of rejection is increased. These 10 studies show that as a result of blood transfusions alloantibodies frequently develop. With each study, the left-sided black horizontal bar shows that after transfusion,

sensitization averages 20 to 40 percent. In the white bars, the non-transfused patients, antibody

production is far less. 12

> More recent data shows that red cell transfusions result in clinically significant increases in HLA antibody strength and breadth, and these HLA antibodies, crucial for transplantation, turn out to be directly related to the specifically donated blood.

If an oral drug like roxadustat was available, the treatment of anemia in non-dialysis CKD, which is so limited today by complexity and inconvenience, would be much more readily

FDA CRDAC July 15 2021 101

accomplished with the potential, as we saw in these phase 3 studies of a 74 percent reduction in blood transfusions, and that could result in far fewer issues with antibody production that delay, complicate, and prevent kidney transplantation.

It is because of the complexity and logistical issues that nephrologists uncommonly

logistical issues that nephrologists uncommonly treat non-dialysis anemia, but the need is absolutely there, and that need is supported by the recommendations of global guideline groups. In fact, there are many anemia in kidney disease guideline groups throughout the world. These expert panels have examined the totality of risk and benefit data.

There is a widespread unanimous consensus
that supports anemia treatment in both dialysis and
non-dialysis CKD. They speak to improving symptoms
and raising hemoglobin to reduce blood
transfusions. Similarly, anemia treatment of both
dialysis and non-dialysis CKD are also widely
approved by FDA and other international regulatory
agencies. The FDA labels say ESAs are indicated

July 15 2021

for the treatment of anemia for CKD in patients on dialysis and patients not on dialysis.

Now, obviously the purpose of today's meeting is not to determine the need for anemia treatment; the world's expert guideline groups have spoken very clearly on the subject. There is no controversy; rather, it's to determine the risk and benefit balance of this drug roxadustat.

It's my strong belief that the benefits of treating anemia with roxadustat in dialysis and non-dialysis CKD patients clearly outweigh the risks, and this novel oral therapy addresses the anemia needs of the spectrum of CKD patient populations, providing therapeutic options and specific benefits as compared and contrasted to the present standard of care.

I'd like to note that I've carefully reviewed the sponsor's plan to adjust recommended roxadustat dosing to limit hemoglobin rate of rise to mitigate thrombosis risk. Importantly, the relationship of ESA dosing, hemoglobin, and thrombosis risk has long been known and is part of

FDA CRDAC July 15 2021 103

the label for all marketed ESAs. The clear 1 demonstration in this program of the relationship 2 between hemoglobin rate of rise with thrombosis 3 points to this long known and well understood 4 phenomenon, and the sponsor's new dosing plan 5 should be highly effective for reducing risk. 6 There are a few disease states that have 7 only one type of treatment available. 8 Nephrologists and patients would like to have choice to be able to decide which treatment is most 10 appropriate. For a patient doing well on ESAs, 11 12 there may be no reason to change, but for my patients, I certainly would like to have choice. 13 In conclusion, we saw that in dialysis there 14 remains unmet needs that oral roxadustat could 15 readily address. I'd like to repeat one in 16 particular. The major effort in the U.S. right now 17 18 to increase transplantation and home dialysis, 19 roxadustat is uniquely situated to help with both. The reduction in transfusions would improve 20 21 transplantation access and the oral route would 22 ease the path to home dialysis.

FDA CRDAC July 15 2021

In non-dialysis CKD, roxadustat would greatly improve the lives of many patients by making anemia treatment so much easier and thereby greatly reducing the number of transfusions and improving opportunities for transplantation. Thank you. I'd now like to turn the presentation over to Dr. Eisner.

DR. EISNER: Thank you, Dr. Fishbane.

My name is Mark Eisner, and I am the chief medical officer at FibroGen. At this time, we'd be happy to take your questions.

Clarifying Questions

DR. LEWIS: We will now take clarifying questions for FibroGen. Please use the raised-hand icon to indicate that you have a question and remember to put your hand down after you've asked your question. When acknowledged, please remember to state your name for the record before you speak and direct your question to a specific presenter, if you can.

If you wish for a specific slide to be displayed, please let us know the slide number, if

possible. Finally, it would be helpful to acknowledge the end of your question with a thank you and the end of your follow-up question with "That is all for my questions," so we can move on to the next panel member. I am going to begin the guestions. two questions. One, Dr. Szczech, you have spent a considerable amount of time talking about reducing iron dose. I think on slide CO-45, it was from 52 to 66 in the two groups, reducing roxadustat dose in inflamed patients and reducing transfusion. However, disturbingly, despite those hypothetical advantages, if anything, there was an increased safety signal or certainly not a noninferior. Can you associate any of those things, for example, the lower iron dose, with any outcome that would be clinically meaningful to a patient -- and I will give you a moment to look at that -- or even less transfusions with more transplants? The other question is that the average dialysis patient is on 13 unique home meds, one of

FDA CRDAC July 15 2021 106

which is a phosphate binder which interferes with roxadustat absorption. This is a heavy burden for them to keep track of, and it is very difficult to do medication reconciliation. It is not dissimilar in the CKD-5 population. No compliance data was presented.

I wonder if you have compliance data. I also can't figure out if the patients on dialysis

also can't figure out if the patients on dialysis actually got the pill at dialysis or somewhere else, or took it at home -- but certainly in the non-dialysis population you should have compliance data from people taking it at home -- and if there were any associations of lack of compliance with either not hitting the hemoglobin targets or rapid rises in hemoglobin.

Thank you. Those are my two questions, and I'll wait for your answers.

DR. EISNER: EISNER: Thank you. It's Mark Eisner. Thank you for the questions. I'll ask Dr. Szczech to address your first question about iron.

Dr. Szczech?

FDA CRDAC July 15 2021 107

DR. SZCZECH: Thank you very much. 1 I don't have a slide for this, however, 2 we did pursue differences in MACE based on 3 differences in changes in ferritin, ferritin at 4 baseline, and there did not appear to be any 5 differences in the major adverse cardiovascular 6 outcomes or any other important safety signals, 7 based on ferritin levels at baseline or changes in 8 ferritin levels at baseline. 9 10 I'll pause here to see if that answers your question. 11 12 DR. LEWIS: Thank you. That answers my question. 13 14 DR. SZCZECH: Thank you. The second question --15 DR. EISNER: Go ahead, Dr. Szczech, please. 16 DR. SZCZECH: The second question was about 17 18 transfusion and differences in transplant outcome. 19 May I ask you to clarify that so I can give you the appropriate information? 20 21 DR. LEWIS: Sure. And actually you could have picked any one of them; I don't know that you 22

July 15 2021

108

have to go through all of them. So if less 1 transfusions, the big advantage is more 2 transplants, did you see more transplants in the 3 roxadustat group? 4 DR. SZCZECH: Thank you very much for that 5 Transplantation, as everyone knows, is 6 highly dependent on multiple factors, which 7 includes your region. The average waiting time for 8 a kidney unfortunately in the U.S. can be as much as four to five years in some areas. 10 So a reduction in transfusion benefits a 11 patient not only initially during their NDD period 12 but for years to come after dialysis is initiated. 13 14 They get on the transplant --DR. LEWIS: Dr. Szczech, I'm sorry. 15 interrupt you? Do you have data to show that your 16 roxadustat group got more transfusions? 17 18 understand the theoretical benefit. 19 DR. SZCZECH: I was trying to explain that examination of this particular endpoint would have 20 21 been out of scope for these studies because, of course, they only looked at the NDD period. So no, 22

July 15 2021

109

we do not have data, and I was just explaining why. 1 Thank you for focusing me. 2 DR. EISNER: Then there was a question, 3 Dr. Szczech, about the compliance both in the NDD 4 and the DD setting. Can you please address that 5 question? 6 7 DR. SZCZECH: I would be happy to. Linda Szczech. 8 9 So it is important to know that roxadustat is not dialyzable, so it can be given both on 10 dialysis and off dialysis. For patients who are 11 dialysis-dependent, you mentioned the interaction 12 with phosphate binders, and we did not demonstrate 13 14 a significant issue in patients who were either on phosphate binders or were not on phosphate binders 15 in our phase 2 studies. Because this is a 16 titratable drug, if the bioavailability is 17 18 decreased by the phosphate binder, the drug can be 19 titrated up to the hemoglobin that is required. I show you here that the interactions with 20 21 the phosphate binders are more so associated with the sevelamer and the calcium-containing phosphate 22

July 15 2021

110

binders. No interaction was seen with lanthanum, 1 and that's a minor technical point that I just 2 wanted to share. 3 In terms of compliance, we found excellent 4 compliance in our clinical trials, and I can try to 5 get you some information after the break to break 6 down exactly how well patients were able to comply 7 with their therapies using the TIW regimen. 8 Did the dialysis patients 9 DR. LEWIS: receive the drug in the dialysis unit? 10 DR. EISNER: Dr. Szczech, the question's for 11 you, please. 12 DR. SZCZECH: Thank you. Linda Szczech. 13 14 We did not specify that they needed to receive the drug in the dialysis unit, but based on 15 our knowledge, we believe that many of them did. 16 DR. LEWIS: Thank you. That's the end of my 17 18 questions. 19 Our first question is Dr. Packer. DR. PACKER: Thank you so much. I just 20 21 wanted to ask just one general question and then one specific one. The general question is the 22

FDA CRDAC July 15 2021 111

mechanism of action. 1 This drug inhibits prolyl hydroxylase, but 2 there are at least four isoforms of that enzyme, 3 and they interact with different isoforms, 4 hypoxia-inducible factor alfa. 5 Can you tell us which isoforms of prolyl 6 hydroxylase are inhibited by roxadustat and what 7 HIF isoforms are potentiated? 8 DR. EISNER: Yes. Thanks for your question. 9 I'll ask Dr. Walkinshaw to address it for you. 10 Dr. Walkinshaw? 11 DR. WALKINSHAW: Yes. Hello. Gail 12 Walkinshaw here. Roxadustat actually inhibits all 13 three of the major isoforms of the prolyl 14 hydroxylase enzyme, so PHD1, PHD2, PHD3. 15 There is a fourth enzyme which you refer to 16 which is a transmembrane prolyl hydroxylase. 17 18 haven't studied that specifically to know whether roxadustat inhibits that, and the function of that 19 enzyme and its role in HIF stabilization is very 20 21 unclear. In terms of the stabilization of HIF, roxadustat stabilizes both HIF-1 alfa and HIF-2 22

FDA CRDAC July 15 2021 112

alfa. 1 DR. PACKER: Just to follow up on that, 2 HIF-1 alfa and HIF-2 alfa often have diametrically 3 opposite effects on tissues. And in particular 4 with respect to the heart, HIF-1 alfa is 5 proangiogenic, proinflammatory, and profibrotic. 6 HIF-2 alfa has the opposing effects. 7 So when you inhibit prolyl hydroxylase, 8 depending on which enzyme your inhibiting, which 9 enzyme is already activated and the tissue, you 10 might have a greater potentiation of HIF-1 alfa 11 12 compared with HIF-2 alfa. Would that be fair? 13 14 DR. EISNER: Dr. Walkinshaw, I'll ask you to respond. 15 DR. WALKINSHAW: Yes. Gail Walkinshaw here. 16 Yes, I think you bring up a very good point. 17 18 It's one of the big challenges that we have in 19 interpreting the literature because many people study either HIF-1 alfa or HIF-2 alfa using genetic 20 21 tools, and that never really gives us an insight into what we would expect with roxadustat where 22

July 15 2021

113

we're stabilizing both of those HIF-alfa paralogs. 1 Also, a lot of the published reports use the 2 genetic tools which leads to chronic captivation of 3 HIF-1 alfa or HIF-2 alfa, and that's, again, not 4 what we're doing with roxadustat. We're only 5 transiently stabilizing both of those. So really, 6 that's why we rely heavily on our non-clinical 7 toxicology studies because that's, really, the only 8 way we can understand what to expect if we're just 9 transiently stabilizing HIF-1 alfa and HIF-2 alfa. 10 DR. PACKER: The only reason I bring this up 11 is because HIF-1 alfa, we really would not want to 12 produce sustained increases in HIF-1 alfa. And the 13 14 effects of prolonged activation of HIF-1 alfa could have many adverse affects biologically and 15 pathophysiologically, which are independent of the 16 rate of rise of hemoglobin. 17 18 That's why I asked the question because, 19 you're right, the available basic science literature, it's really hard to make this 20 21 prediction. But I make it only because of my second question, which is to segue to the endpoint 22

July 15 2021

114

I think I would like to personally focus on, which 1 is all-cause mortality. 2 The reason for focusing on that is, gee, 3 all-cause mortality is really important and, two, 4 all-cause mortality is fairly agnostic about 5 mechanisms. So if HIF-1 alfa potentiation leads to 6 proinflammatory and profibrotic effects, you may 7 not pick that up on a conventional MACE endpoint. 8 So just focusing on all-cause mortality, you 9 have a lot of all-cause deaths in your trials, so 10 you have a good event rate and the ability to 11 discern what's going on. And I agree with you that 12 your NDD populations, the analyses are really 13 difficult. 14 It's really very, very complicated to try to 15 tease out the event rate, but you don't have that 16 problem in the DD population. In fact, your 17 18 retention rate in the DD population is a little bit 19 higher in the epo group than the roxa group. Can you put up a slide on all-cause 20 21 mortality in the four individual trials in the DD population? 22

July 15 2021

115

```
DR. EISNER: Yes, we will do that.
                                                  I will
1
      ask Dr. Little to respond to that question.
2
     while we're bringing it up, I'd like to ask Dr. del
3
     Balzo to just briefly talk to you about our
4
     preclinical data on cardiovascular issues.
5
             Dr. del Balzo, can you summarize that for
6
     us? And then I'll to Dr. Little on the all-cause
7
     mortality aspect of your question. Yes, Victor
8
     does also here. Yes, thank you for the question.
9
             DR. DEL BALZO: Yes. Ughetta del Balzo
10
             Yes, thank you for the question.
11
12
             I think it's important to just take a moment
      to look at our toxicology program at a high level.
13
14
      In this program, we have evaluated roxadustat
      chronically up to one year in monkeys. In general,
15
      as observed with ESA, the high roxadustat doses
16
      induced alterations caused by exaggerated
17
18
     pharmacology. So these are consequences of
19
      increased red blood cell production inducing
     polycythemia and hemoconcentration.
20
21
             [Inaudible - audio gap].
             DR. PACKER: Hello?
22
```

July 15 2021

116

DR. EISNER: Dr. del Balzo, I think we lost 1 Why don't we go to Dr. Little for the 2 vou. clinical data in DD for all-cause mortality. 3 Dr. Little? 4 DR. LITTLE: Dustin little here. 5 Dr. Packer, I have a slide that has the 6 7 pooled all-cause mortality result and then the results for each of the three pivotal trials, and 8 9 then we can bring up the slide that showed the results for 613. 10 The pooled hazard ratio point estimate was 11 1.02, and you see the hazard ratio point estimates 12 for each of the three pivotal studies. Overall, we 13 14 didn't see a significant interaction and we saw a substantial overlap between the confidence 15 intervals. 16 Now I have the slide that also shows 17 18 Study 613. When we add Study 613 to the pool, 19 Dr. Packer, we mentioned that that study is an outlier in terms of the all-cause mortality 20 21 results. We have a hazard ratio point estimate of 1.11; but again, overall in the three pivotal study 22

July 15 2021

117

```
pools, a hazard ratio point estimate of 1.02.
1
     we consider that there's no increased risk of
2
      all-cause mortality with roxadustat compared to
3
      epoetin alfa.
4
             DR. PACKER: Well, let me have you pause
5
     there for a moment, and let me just make sure that
6
      I totally understand how you're going about doing
7
     this.
8
9
             This is all-cause mortality --
             DR. LEWIS: Dr. Packer?
10
             DR. PACKER: Yes?
11
                          I'm sorry. We have a lot of
             DR. LEWIS:
12
      questions.
                 Can you keep this a little bit shorter?
13
14
             DR. PACKER:
                           Okay.
             Can you explain why your analysis of
15
     all-cause mortality differs from that of the FDA?
16
             DR. EISNER: Dr. Little, I'll ask you to
17
18
      respond to the question, please?
19
             DR. LITTLE: Dustin Little.
             Dr. Packer, I may need to ask for
20
21
      clarification for the analysis of all-cause
     mortality on differing. What we have here are the
22
```

July 15 2021

118

```
results for our pooled Cox regressions.
1
             DR. PACKER: Julia, I'm going to pause
2
3
     here --
             DR. LEWIS: Yes, thank you.
4
             DR. PACKER: -- but I just want to make the
5
     point that the analysis that they just showed is
6
     based on 264 plus 277 events. The FDA analysis of
7
     all-cause mortality in the same population has more
8
      than 800 events.
9
10
             DR. LEWIS: Okay. Thank you, Dr. Packer.
             I'm going to go on to Dr. Bairey Merz.
11
     please, everybody, remember, even though I'm
12
      announcing you, to state your name for the record
13
14
     before you ask your question.
             DR. BAIREY MERZ: Thank you, Dr. Lewis.
15
             Noel Bairey Merz. This is a question for
16
     Dr. Fishbane, two just very general questions.
17
18
             You said in your remarks that likely
19
     dialysis patients on epo probably would not be
      encouraged to change to the oral roxa, and as a
20
21
     guideline writer and as a representative of what
      likely will be future guidelines, what do you think
22
```

July 15 2021

the guidelines will say about who would prefer to be on the oral form? And as a second related question, would you advise for or against non-nephrology prescribing this medication? Thank you.

DR. FISHBANE: Yes. Thank you for the question. In dialysis, I'm not going to anticipate, we are going to be having a KDIGO updated global guideline group that will be coming out. But in terms of the use of the drug in patients on dialysis, what I said before my presentation was that if I have a patient who is currently on ESA, and is doing well, and is not experiencing problems, then I wouldn't necessarily see a reason to change that patient.

On the other hand, look, I'm the chief medical officer for a 15-dialysis unit chain, and in individual dialysis units there are maybe units where we prefer not to be using our nurses running around opening up vials of medications, filling syringes, and injecting patients. There may be places where we prefer three times a week doing

oral treatment. 1 Certainly, with issues related to 2 hyporesponse, with issues related to home dialysis, 3 4 and this very difficult problem we have with the transition in those first very difficult months of 5 dialysis, I see a really important opportunity in 6 terms of oral treatment. But I think I'm not going 7 to go further towards anticipating what we'll do 8 with quidelines, but I do appreciate the question. 9 DR. LEWIS: Dr. Fishbane, we have quite a 10 few more questions. Could you address Dr. Bairey 11 Merz's second question; would you recommend 12 non-nephrologists use this drug? 13 DR. FISHBANE: Yes, I generally recommend 14 that it would be best used in the hands of 15 nephrologists who are taking care of patients, 16 both --17 18 DR. LEWIS: Thank you. 19 DR. FISHBANE: Thanks. DR. BAIREY MERZ: Thank you. 20 21 DR. LEWIS: Thank you. Dr. O'Connor? And please announce yourself. 22

FDA CRDAC July 15 2021

121

DR. O'CONNOR: Yes. Chris O'Connor. This 1 is a question for Dr. Szczech or Dr. Little. 2 Ιn heart-failure trials, quality of life and 3 hospitalizations are very important outcomes. 4 Ιn page 28 and page 56 of your briefing document, in 5 28 you provide a quality-of-life analysis of the 6 SF-36. Although you got a statistically 7 significant difference despite getting an important 8 anemia correction, there were no clinically 9 meaningful differences. 10 Is it your position that this drug does not 11 improve quality of life despite correcting anemia? 12 That's part A. And part B is, what is the effect 13 of this drug on total and cardiovascular 14 hospitalizations? I saw the heart failure and 15 16 unstable angina trended in the right direction, but I didn't see total and cardiovascular 17 18 hospitalizations. 19 DR. EISNER: Yes. This is Mark Eisner. I'll ask Dr. Fishbane to address your question on 20 21 quality of life, and then Dr. Little on hospitalization. 22

FDA CRDAC July 15 2021

Dr. Fishbane?

DR. FISHBANE: Yes. Thank you.

Look, quality of life has been a historically very difficult challenge with respect to anemia treatment. A lot's been written on the subject. We could get into some of the issues if we want to discuss that further, but I do find that what we've seen here to be, despite the challenges, actually guite encouraging.

The key parameters in a double-blinded population with lots of patients here; we saw that for physical function of vitality, and that's where the keys have been in previous studies, a similar benefit, as we've seen previously, which gives us a sense that there is an opportunity here.

So we've got to be conservative with quality of life because of the difficulties of these studies, but I think despite the crude scales and mixed comorbidity, we're definitely seeing here an opportunity from that data to be able to do some of the guideline-recommended individualization of treatment. Thank you.

```
DR. EISNER:
                           Thanks.
1
             Dr. Little, can you address the
2
     hospitalization question?
3
4
             DR. LITTLE: Dustin Little.
             Dr. O'Connor, I don't have a slide available
5
      for overall cardiac hospitalization, but I'd like
6
      to bring up adjudicated heart-failure
7
     hospitalization Kaplan-Meier plots for the pooled
8
     NDD and the pooled DD and just demonstrate those.
9
              You can see that for the pooled NDD
10
      adjudicated heart failure, hospitalization was
11
      somewhat numerically lower for roxadustat,
12
      especially earlier on, and then you see the hazard
13
      ratio point estimate of 0.83 with the upper bound
14
      of 1.05 for adjudicated heart failure
15
     hospitalization. In terms of overall
16
     hospitalization, 58.6 percent of roxadustat
17
     patients in the DD program required hospitalization
18
19
      compared to 59.5 percent of epoetin alfa patients.
              DR. LEWIS:
                          Thank you.
20
21
             Mr. Conway?
              (No response.)
22
```

DR. LEWIS: Mr. Conway, you may need to unmute.

MR. CONWAY: Got it. Thank you very much; two quick questions, a general question to the presenters.

Because we're dealing with pooled data here, can you tell me whether or not any publications have been withdrawn based on initial publication?

And along that line, do you have -- please don't take this the wrong way, but I'm going to ask it.

Do you have full confidence in the data that was generated by your partner in China?

Then the second question actually I have for Dr. Fishbane is, given the data that you're looking at and given the population, or probably the expanse of the patient population that you were treating that you just identified across many facilities, would you approach African American patients differently with this medication who are on dialysis given the data?

I'm interested in that specifically because of outcomes. And by way of background, let me just

FDA CRDAC July 15 2021

say this. I was an ESA patient, iron infusion 1 patient, did it before dialysis, did it while I was 2 on home peritoneal dialysis, and I've had an 3 4 adverse incident. So I kind of have a general understanding of this in a little bit more detail, 5 but I'm interested in those two questions. 6 DR. EISNER: Thanks for your question. 7 It's Mark Eisner. In terms of your first question, 8 there were two parts. One was about do we have 9 full confidence in our trials in China, and we do. 10 This was conducted by FibroGen China, which is part 11 12 of FibroGen overall, so we have full confidence there. 13 14 I'll ask Dr. Szczech to address your question about publications. 15 DR. SZCZECH: Thank you very much. Linda 16 Szczech. We have had all of our publications 17 18 accepted and we're working on getting them into 19 publications. None of them have been withdrawn. DR. LEWIS: Thank you. 20 21 Dr. Parsa? DR. EISNER: And --22

DR. LEWIS: I'm sorry? 1 DR. EISNER: Pardon me for 2 interrupting -- it's Mark again -- but there was a 3 question about African American patients. Can we 4 have a moment to dress that? 5 DR. LEWIS: Surely. 6 DR. EISNER: Well, first just to say that 7 the efficacy in terms of hemoglobin was the same in 8 African American patients versus patients of other 9 races and ethnicities. 10 Let me ask Dr. Little just to briefly 11 address the safety in African American patients. 12 Dr. Little? 13 14 DR. LITTLE: Thank you. Dustin little. Mr. Conway, we did look at safety events by 15 race, and we didn't see -- let me bring up as an 16 example the MACE results in the dialysis-dependent 17 18 population. For black patients, we didn't see any 19 interaction by race. We consider that the overall safety results that we presented today are 20 21 applicable to black patients. I'd just like to briefly note that we're 22

July 15 2021

127

```
adding a 10,000-patient postmarketing study in the
1
      United States, and we would expect there to be a
2
      substantial number of African American patients in
3
      that study for us to look further at thrombosis,
4
      vascular access thrombosis overall and in
5
      African American patients.
6
                           I appreciate that. I just want
7
             MR. CONWAY:
      to make this note. The reason why I'm asking that
8
9
      question specifically is because I wanted to know
      what your data showed before you take it out and
10
      put it in the field, if that is the course that's
11
12
      taken, and expose patients to it. Thanks.
             DR. LEWIS:
                          Thank you.
13
             Dr. Parsa?
14
             DR. PARSA:
                          This is Afshin Parsa.
15
             Regarding this thrombosis risk on MACE and
16
     some of the subanalyses -- and the NDD certainly
17
18
     has been challenging, I appreciate the efforts -- I
19
     was wondering, were there any subgroup analyses
     looking at people on aspirin, clopidogrel,
20
21
     antiplatelet or anticoagulants, and whether that
22
     changes any of the outcomes?
```

July 15 2021

128

DR. EISNER: I'll ask Dr. Little to address 1 your question about whether antiplatelet agents 2 modify the safety of roxadustat. 3 Dr. Little? 4 DR. LITTLE: Dustin Little. We have 5 performed those analyses. I don't have a slide 6 7 available to show you that, but we did not observe any particular interaction in terms of 8 cardiovascular safety or thrombosis among patients 9 10 who were or were not on antiplatelet agents at baseline. 11 12 DR. LEWIS: Thank you. Dr. Thadhani, did that conclude your 13 14 question? If so, I'll move on to Dr. Wang. DR. WANG: Thanks a lot. Tommy Wang; two 15 quick questions. 16 One, I suspect a lot of the discussion is 17 18 going to focus on risk-benefit, and the point was 19 raised about risk-benefit in the dialysis patients with high CRP levels indicating inflammation as 20 21 potentially favoring roxadustat because of the less of the need for escalation of dosing. 22

Does the sponsor have any specific data 1 regarding either MACE events or adverse events in 2 3 roxadustat compared with epo in the high CRP patients in the dialysis population? That's one 4 question. 5 The second question, just returning to the 6 point Dr. Packer raised about VEGF, I appreciate 7 that there were relatively few malignancies that 8 9 occurred during the trials. Can the sponsor 10 comment on any general longer-term concerns regarding malignancies, either incident or 11 exacerbation or latent malignancy, and how they 12 plan to incorporate that into the postmarketing 13 trial that they've proposed, if postmarketing is 14 available? 15 DR. EISNER: Yes, thanks for your question. 16 I'll direct the first question on CRP in MACE to 17 18 Dr. Little. 19 DR. LITTLE: Dustin Little. Yes, Dr. Wang, we did perform an analysis of MACE risk by baseline 20 21 I'll bring it up momentarily, but as Dr. Szczech mentioned during her presentation, 22

FDA CRDAC July 15 2021 130

baseline CRP was actually only assessed in 4 of the 6 pivotal trials. It was not assessed at baseline in the two largest pivotal trials. In addition to the typical limitations of a subgroup analysis being post hoc and underpowered, we do have those limitations here.

In terms of the non dialysis population, we had 31 percent of patients without a CRP collected at baseline. When we look at the pattern of those events over time, we see absolutely no difference in MACE over the first approximately 12 months; so it's likely that differences in treatment discontinuation impacted these results.

Among the dialysis-dependent population, we had about 16 percent of patients without baseline CRP available, and interestingly among those patients, the hazard ratio point estimate was numerically favorable. I'm showing you the incident dialysis subpopulation because, simply, this is the group where we had less missing data, about 9 percent of patients, and we saw no interaction there.

July 15 2021

I'd like to briefly bring up the subgroup analysis by baseline ferritin tertiles because we know that ferritin is also elevated in inflammation and can be a marker of inflammation, and this was not so confounded by missing data. And in here we saw no interaction in NDD or DD. So we don't consider that there's an interaction by inflammation, and we consider that these ferritin values are more reliable due to the completeness of the data.

DR. EISNER: Then your second question about concern about malignancy, overall, when we look at our data overall, the short answer is we don't see an imbalance of malignancy, and we did follow patients up to four years. So to the best of our knowledge, we don't have a risk there.

In terms of the postmarketing setting, it's a good point. We are certainly in active discussions with FDA about the nature of the postmarketing real-world data study, and it certainly would be possible to add ascertainment of malignancy, benign or malignant tumors, to that

July 15 2021

132

```
1
      study. So it's a fair point, and thanks for
      raising it.
2
             DR. LEWIS: Dr. Thadhani, I apologize.
3
      skipped you. I'm going to let you have the last
4
     question.
5
             Those of you who have had your questions
6
     answered and don't have another one, please put
7
     your hands down, and we will make a list of the
8
     remaining people who have questions that we haven't
9
     got to, and hopefully we'll have time to work those
10
      in later.
11
             Dr. Thadhani?
12
             DR. THADHANI: Thank you, Dr. Lewis, and I
13
     will be brief.
14
             The sponsor nicely showed dose-response
15
      relationships, change in hemoglobin, and a proposal
16
      in a postmarketing fashion to potentially reduce
17
18
      the risk of thromboembolic events by the
19
     associative data. Certainly the adverse event
     profile includes other adverse events that were
20
21
      seen: infections, seizures, stroke, MI, acute
     kidney injury.
22
```

July 15 2021

133

Is there any evidence, even by way of 1 association, that changing or the proposals that 2 are suggested by the sponsor would have effects on 3 some of those other adverse events? Thank you. 4 DR. EISNER: No, thanks for the question. 5 That's a good question. I'll turn that to 6 Dr. Little to respond. 7 Dr. Little? 8 DR. LITTLE: Dustin Little. 9 Dr. Thadhani, when we looked through our 10 data, the clearest association that we saw was with 11 thrombosis events and that's what we're targeting 12 with our risk mitigation. We found some 13 publications that have demonstrated that similar 14 risk mitigation strategies appear to have decreased 15 thrombosis risk with ESAs. 16 When it comes to other events, like I said, 17 18 we did not see clear evidence that our mitigation 19 strategy would influence other events. Seizure, for example, has potentially been associated with 20 21 ESAs with more rapid increases in hemoglobin and treating to higher targets, and of course our 22

FDA CRDAC July 15 2021

```
mitigation strategy will lead to more gradual
1
      increases in hemoglobin and treating to lower
2
                But in sum, our risk mitigation is aimed
3
4
     at the thrombosis and vascular thrombosis risk that
     we noted in our clinical program.
5
              DR. LEWIS:
                          Thank you.
6
             We will now take a five-minute break.
7
                                                     Panel
     members, please remember that there should be no
8
      chatting or discussion of the meeting topic with
9
      anyone during the break. We will resume at 11:59.
10
      Thank you.
11
12
              (Whereupon, at 11:55 a.m., a recess was
13
     taken.)
              DR. LEWIS: Good afternoon. My name is
14
     Dr. Saleh Ayache. I'm a medical officer in the
15
     Division of Non-Malignant Hematology.
16
              DR. YU:
                      Dr. Ayache?
17
18
             DR. AYACHE:
                           I'm sorry.
19
             DR. YU: Can you give us one moment?
              Dr. Lewis, could you announce our return
20
21
      from the break?
              (Pause.)
22
```

DR. YU: One moment, please. 1 Dr. Lewis, could you hear me? 2 I apologize. 3 DR. LEWIS: Thank you. 4 Actually, I don't think I muted myself there, but I want to ask all everybody to put their hands down. 5 Ms. Yu and I have made a list of the people 6 with remaining questions, and I think it will be 7 confusing if they stay up now. 8 We will now proceed with the FDA 9 presentation, Dr. Ayache. 10 (No response.) 11 DR. YU: Dr. Ayache, you might be on mute. 12 You may proceed 13 14 DR. AYACHE: Yes. DR. YU: Okay. Thanks. 15 FDA Presentation - Saleh Ayache 16 DR. AYACHE: Good afternoon. My name is 17 18 Dr. Saleh Ayache. I'm a medical officer in the 19 Division of Non-Malignant Hematology in the Office of Cardiology, Hematology, Endocrinology, and 20 21 Nephrology. I'll be presenting the FDA's major findings from the roxadustat application along with 22

July 15 2021

136

Dr. Jae Joon Song from the Division of 1 Biometrics VII, Office of Biostatistics. 2 Here is the review team assessing the 3 application. This is the outline of our 4 presentation. We will briefly discuss the product, 5 the regulatory history, and efficacy, but the focus 6 for our presentation will be the safety findings. 7 We will discuss the adverse events, major adverse 8 cardiovascular events, all-cause mortality, and 9 finally we will discuss some of the 10 interrelationships between thromboembolic events, 11 12 drug dose, hemoglobin, and rate of change of hemoglobin. 13 14 Roxadustat is a small molecule, oral, hypoxia-inducible factor prolyl hydroxylase 15 inhibitor that's posited to enhance erythropoiesis 16 by increasing endogenous erythropoietin and 17 18 reducing hepcidin. The drug is the first in its 19 The proposed indication is for the treatment of anemia due to CKD in adult patients 20 21 not on dialysis and on dialysis. Roxadustat is an orally administered tablet. 22

July 15 2021

The roxadustat dose is adjusted on the basis of the hemoglobin response. The drug is not approved in the U.S. It has been approved in China and Japan for patients on dialysis and not on dialysis.

Anemia is associated with increased cardiovascular morbidity and mortality. Anemia in patients with CKD is multifactorial, including erythropoietin deficiency, impaired ability to absorb and utilize iron, and blood loss and shortened RBC survival.

The current standard of care includes protein iron monitoring and supplementation of patients with iron deficiency. Most patients require ESAs to correct anemia and to reduce the need of RBC transfusion. However, transfusions have risks, including alloreactivity and increased risk of rejection after kidney transplantation.

ESAs are glycoproteins produced by recombinant technology. They have been in the market in the U.S. since 1989. There are four ESAs approved for this indication. All are approved for patients on and not on dialysis. All are

July 15 2021

administered intravenously or subcutaneously. None are oral.

Four large randomized-controlled targeted studies have shaped the labeling of ESAs: the normal hematocrit, the CHOIR, CREATE, and TREAT. They were all designed to demonstrate that higher hemoglobin targets would result in better clinical outcomes, but instead they showed, or tended to show, adverse cardiovascular outcomes with higher rather than lower hemoglobin targets. More than 30 years since the first approval of an ESA, the optimum hemoglobin target remains unknown.

In light of these prior results, the ESA label for CKD has undergone significant revisions, including the addition of a boxed warning and several warnings and precautions.

Here you see the boxed warning for the ESAs as related to chronic kidney disease. It highlights the risk of death, myocardial infarction, stroke venous thromboembolism, and thrombosis of vascular access. It also warns that targeting hemoglobin greater than 11 grams per

FDA CRDAC July 15 2021 139

deciliter increases the risk of death, serious adverse cardiovascular, and stroke. The warnings and precautions section of the ESA labeling highlights other important risks of hypertension and seizure.

After the fourth large randomized trial suggested harm rather than benefit when targeting higher rather than lower hemoglobin levels, the former division discussed the three prior results at the 2010 cardio-renal drug advisory committee meeting. We asked whether the indication for treatment of anemia in patients who are not on dialysis should be withdrawn; 15 out of 17 members voted no.

The roxadustat development program proceeded concurrently in the non-dialysis-dependent, NDD, and dialysis-dependent, DD, populations. For each patient population, there were three main phase 3 studies and one additional trial. Therefore, there was a total of four studies in the NDD indication and four studies in the DD indication.

Efficacy was assessed as the change from

baseline in the mean hemoglobin levels over weeks 28 to 52. The study tested either superiority to placebo or noninferiority to ESA with respect to hemoglobin. For safety, the applicant assessed major adverse cardiovascular events, or MACE, comparing roxadustat to placebo in the NDD population and comparing roxadustat to epoetin alfa in the DD population. In addition, we performed typical general safety assessment of adverse events, laboratory data, and vital signs. As I noted, there were four major phase 3 studies in the NDD population. The phase 3 studies on the slide, 001 060, and 608, were similarly designed multicenter, randomized, double-blinded, placebo-controlled study in patients with stage 3 to 5 CKD and anemia. Notice that not all the randomization ratios are the same. The primary endpoint was changed from baseline to mean hemoglobin concentration. Study 610 differed in that it was conducted in

Europe with an open-label design and it compared

roxadustat to active-controlled darbepoetin alfa.

July 15 2021

Also for 610, the primary endpoint was different from the others. It was percentages of hemoglobin responders during the first 24 weeks.

For the DD population, there were also four major phase 3 studies. The study at the top, 002, 063, and 064, were similarly designed, multicenter, open-label, active-controlled trials that compared roxadustat to epoetin alfa. Study 002 and 063 were global and Study 064 was conducted in the U.S.

The fourth major study was 613. This study was conducted exclusively in Europe. Study 613 differed from the other three studies because it employed two active comparators, darbepoetin and epoetin alfa, and permitted use of an ESA that is licensed in the U.S. For all four studies, the primary endpoint was changed from baseline in the hemoglobin concentration.

We corroborated the applicant's efficacy results of increasing the hemoglobin and believe that the applicant has provided substantial evidence of efficacy for the indication they are seeking. Our concern about efficacy is that the

20

21

22

hemoglobin concentration in the roxadustat groups in these studies tended to overshoot its target. We will start with the efficacy results for the NDD population. Here are the results for the three placebo-controlled studies. The Y-axis shows the hemoglobin concentration and the X-axis shows time in weeks. Roxadustat is shown in blue and placebo is shown in red. Note the blue arrows. All studies appear to show overshoot of the hemoglobin target followed by downward correction. The overshoots may have been related to the roxadustat starting dose, the dosing scheme, or both. One of the secondary endpoints was time to RBC transfusion. In Study 001, the time to RBC

One of the secondary endpoints was time to RBC transfusion. In Study 001, the time to RBC transfusion analysis shows a statistically significant treatment effect with a hazard ratio of 0.37. In Study 060, there was a lack of statistical significance for an endpoint more proximal in the testing sequence, so there could be no formal test of hypothesis on the time to RBC transfusion endpoint.

FDA CRDAC July 15 2021 143

The treatment effect on time to RBC 1 transfusion was nominally statistically 2 significant. In Study 610, time to RBC transfusion 3 was not included in the testing sequence. An 4 exploratory analysis indicates a nominally 5 statistically significant treatment effect. 6 The figure shows the percentages of subjects 7 who received at least one RBC transfusion in the 8 three NDD studies. The blue bars are for roxadustat and the red bars are for placebo. 10 exploratory analysis suggests that there was 11 absolute reduction in the percentages of patients 12 receiving an RBC transfusion of approximately 13 10 percent for roxadustat over placebo in each of 14 the three studies. 15 Here are the efficacy results for Study 610. 16 The study met its primary efficacy endpoint 17 18 objective in hemoglobin response. In the graph on 19 the right, note that the hemoglobin increases more

rapidly in the roxadustat group than the darbepoetin alfa group through 4 weeks; also note that the hemoglobin level reaches nearly 12 grams

20

21

22

per deciliter at 12 weeks.

Now I will discuss the efficacy results for the DD population. Hemoglobin responses are shown graphically for the three studies. Roxadustat is shown in blue and epoetin alfa is shown as red. On the left top and bottom, in Study 063 and 002, you see the mean hemoglobin responses in the roxadustat groups were similar to the responses in the epoetin alfa groups.

In Study 064, which was the U.S. study, the hemoglobin in the roxadustat group trends higher than the epoetin alfa group with the mean differences of 0.5 gram per deciliter. The test for noninferiority for the difference in the hemoglobin between roxadustat and epoetin alfa of minus 0.7 gram was met for each study.

Here are the Study 613 efficacy results.

613 also demonstrated noninferiority of roxadustat with respect to ESA comparators. The graph on the right shows the mean hemoglobin response over time. The scale exaggerates the treatment effect, but note the rapid increase in hemoglobin in the

145

roxadustat group starting at time zero. The

difference in mean hemoglobin response developed

rapidly with big treatment differences of

approximately 0.8 gram for roxadustat over ESA

comparator.

Now I will discuss the safety of roxadustat.

Safety analyses were performed in the NDD and DD

populations separately. The mean safety analysis

in the NDD population was conducted using the

10 4270 subjects in the three double-blind,

placebo-controlled studies, Studies 001, 060, and

608. Study 610 was analyzed separately. The main

safety analysis in the DD population was conducted

using 3880 subjects in Study 002, 064, and 063.

15 Study 613 was analyzed separately.

In order to interpret the safety analyses, it's important to understand the concept of the ascertainment window. The ascertainment window is the time on treatment plus an interval of additional monitoring time during which adverse events can be recorded. Events that occurred outside the window are not included in the

analyses.

Analyses of adverse events were conducted using three ascertainment windows. This slide depicts the on-treatment plus 7-days analysis and includes events from first day of treatment until 7 days after last dose. Similarly, the time on-treatment period plus 28 days, or OT plus 28, includes the treatment period plus 28 days after the last dose of the study indication.

The term "on-study" includes all adverse events that occurred after randomization until the end of the study, regardless of whether the patient was on or off study treatment. You can understand that the longer the period of observation, the more likely you are to collect adverse events that occurred after drug exposure and are not drug related, but for adverse events with longer latency, it's important to monitor for a longer duration. The optimal ascertainment window can differ depending on the type of adverse event that is being considered.

For the most part, our safety analyses were

FDA CRDAC July

July 15 2021

conducted using queries. These included a combination of medically similar and/or related preferred terms. The FDA is developing a standard set of custom queries for new drugs. For example, the FDA query for acute kidney injury is shown in the left. All of these terms indicate a reasonable likelihood that acute kidney injury occurred. An example of custom query of device/shunt thrombosis is shown on the right and it includes 10 related preferred terms that all denote device or shunt thrombosis.

Now we will discuss the adverse events starting with the NDD population. We are not showing the data by treatment group, but for each of the pooled NDD studies, the demographic and baseline disease characteristics generally well balanced between the two treatment groups.

Overall, the mean age was 63 years. The majority of patients were female and overall white. Note, approximately 8 percent of the study population were black. U.S. participation varied by study but overall about a quarter of patients

FDA CRDAC July 15 2021 148

were from the U.S. Few patients had received prior ESA treatment. One-third had a known history of cardiovascular disease.

There were significant differences in disposition between the roxadustat and placebo groups. Thirty-eight percent of subjects in the roxadustat groups discontinued treatment early versus 59 percent of subjects in the placebo groups. The difference was driven by the need for rescue therapy and subjects' decisions differing by about 10 percent.

This Kaplan-Meier graph illustrates the differences in drug exposure between the roxadustat groups in blue and placebo groups in red. The mean roxadustat exposure was 85 weeks compared to 64 weeks for placebo. The lines diverge from each other and reach peak difference at 52 weeks, at which time 71 percent of patients in the roxadustat groups and 53 percent of patients in the placebo groups remained on treatment.

Now I will begin the presentation of the adverse events in these studies. Realize that we

FDA CRDAC July 15 2021

looked for hundreds of signals in two groups of three studies and two individual studies. Signals that were observed across more than one analysis or study are more likely to be drug related. This is a tabulation of serious adverse events organized by category.

The listings are mostly adverse event queries, although there are a few individual preferred terms as well. Individual terms are followed by word terms. For example, deep vein thrombosis is an individual term, though it falls within the query of thrombotic events.

These two columns show the numbers and percentages of subjects with events. These two columns show the event rate per patients-years. The column with the red bars shows the risk difference per 100 patient-years. Finally, the column with the blue bars shows the relative risk based on patient-years.

The listed adverse events and queries are those that were reported at a rate of at least 0.5 events per 100 patient-years with roxadustat,

22

July 15 2021

150

with a relative risk of at least 1.3. Others are listed because they were of particular interest. The ascertainment window here is on treatment plus 7 days. Roxadustat shows a clear signal for serious thrombotic events with a relative risk of 1.45. Important serious adverse events that contribute to this query include device/shunt thrombosis with a relative risk of 2.7 and deep vein thrombosis where there are 20 versus 2 events and a relative risk of 6, also. Stroke and pulmonary embolism, keep in mind that the absolute risk of device/shunt thrombosis is underestimated here because most of these patients in these studies were not on dialysis. Other identified signals include intracranial hemorrhage and seizures. The risk of serious infection includes increased risk for septic shock; urinary tract infection; bacterial infection as a general category; and peritonitis. In contrast to the placebo-controlled studies, Study 610 compared roxadustat to darbepoetin alfa. Again, note the serious adverse

FDA CRDAC July 15 2021 151

events of infection, including bacterial infection and pneumonia were reported, higher percentages for roxadustat than darbepoetin alfa, and with a relative risk of 1.3 or greater. The thrombotic risk is a particular concern here because roxadustat was compared to darbepoetin alfa, which itself is known to cause thrombosis.

Now we will examine all adverse events in the NDD pooled studies for serious and non-serious adverse events. Again, we are showing results for analyses based on the OT-plus-7 window, and here we show events where the rate was greater than 2 per 100 patient-years in the roxadustat group and where the relative risk was greater than 1.2.

There are some adverse events of particular interest. Again, there are notable signals for thrombosis and sepsis although the majority of these events were serious in nature and were shown in the last tabulation. In other words, most adverse events of thrombosis and sepsis were serious. There were relatively few non-serious events.

FDA CRDAC July 15 2021 152

So if we focus on the other adverse events that are largely non-serious, we see hyperkalemia nausea, vomiting, insomnia, and peripheral edema. There are also far more seizures here, indicating that many seizures were non-serious.

For Study 610, we see the adverse events
that occurred at a frequency greater than 5 percent
in the roxadustat arm. Again, there are signals
for peripheral edema and fluid overload and also
for thrombosis, insomnia, and nausea as we saw in
other studies in the NDD population. The new
signals observed in this study included
hyperphosphatemia; muscle spasms; dyspnea; also
arrhythmia; constipation; headache; hypotension;
and bronchitis.

Now I will discuss the adverse events in the dialysis population. We are not showing the data by treatment arm, but the baseline demographics and disease characteristics where relatively well balanced between treatment arms for the dialysis-dependent population.

The mean age was 54 years overall. Most

July 15 2021

patients were male and overall white. Overall, approximately 45 percent were from the U.S., although all subjects in Study 064 were from the U.S. Almost 90 percent were on hemodialysis and 43 percent had a history of cardiovascular disease.

In the pooled DD population, the rate of early discontinuation was higher in the roxadustat group than the epoetin alfa group, 42 percent versus 34 percent. The reasons for discontinuation were adverse events and subject or physician decision to leave the study.

This Kaplan-Meier graph illustrates study drug exposure for the DD population, with the blue line representing roxadustat exposure and the red line representing epoetin exposure. Mean exposures were 89 weeks in the roxadustat-treated subjects and 101 weeks in epoetin alfa-treated subjects.

Approximately 63 percent and 71 percent of patients in the roxadustat and epoetin alfa groups, respectively, received the study drug for at least 52 weeks.

This table shows serious adverse events for

July 15 2021

the pooled studies in the DD population. We have tabulated adverse event queries and some individual adverse event terms, where the event rate was greater than 0.5 per 100 patient-years and the relative risk was at least 1.3, as well as some other notable signals.

Because roxadustat was compared to an active ESA control group in these studies, it's important to consider known adverse drug reactions of ESA when assessing roxadustat's risks. Thus, we show the known adverse drug reaction for ESA at the bottom of the table.

Again, you see prominent signals of serious thrombotic events, including device or shunt thrombosis, deep vein thrombosis and myocardial infarction, as well as seizure.

It's important to recognize that these signals appear against epoetin alfa as the comparator rather than placebo, and note that thrombosis, MI, and seizures are listed as adverse drug reactions in ESA labeling. Signals for adverse events of hypoglycemia, gastroenteritis,

July 15 2021

and pancreatitis are evident here although they were not detected in the in NDD studies.

Now for the single study in the DD population, Study 613, as you recall, Study 613 compared roxadustat to an ESA group that included darbepoetin alfa and epoetin alfa, and this study was not included in the pooled analyses. This table lists the serious adverse events that occur at a frequency greater than 5 percent in the roxadustat group, with a relative risk that exceeded 1.3 in Study 613.

Notable serious adverse events include congestive heart and thrombosis of vascular access. Both are listed as an adverse drug reaction in the ESA level. In addition, there is a risk of serious infection, which was also observed in the pooled NDD analyses.

Here are all adverse events in the pooled DD studies for the OT-plus-7 time period for serious and non-serious. The table shows adverse event queries reported at a rate of greater than 2 per 100 patient-years in the roxadustat group,

16

17

18

19

20

21

22

July 15 2021

156

where the relative risk for roxadustat was greater 1 than 1.3. Other notable adverse events are shown 2 as well. The thrombotic event shows up as 3 expected, however, most of these events were 4 serious such that the addition of non-serious 5 events here does not add much information. 6 Seizures shows up again in the serious 7 adverse events, however, almost half of the 8 seizures were non-serious. Again, seizures are 9 labeled adverse drug reaction for ESAs. There is a 10 signal for vomiting, which is consistent with the 11 signal observed in the pooled NDD analysis. Small 12 signal for hypertension, peripheral edema, and rash 13 14 are apparent versus ESA, and they are labeled adverse drug reactions for ESAs. 15

Again, we see a signal for thrombosis. Sorry.

This slide shows all adverse events identified in Study 613 with a frequency greater than 5 percent in the roxadustat group and a relative risk that exceeded 1.3, as well as other significant adverse events.

FDA CRDAC July 15 2021

Again, we see a signal of thrombosis with roxadustat, which included deep vein thrombosis, pulmonary embolism, and device/shunt thrombosis.

Contrary to other studies in the DD population, MI and ischemic stroke favors roxadustat over ESA and are shown for completeness. There are signals for nausea and congestive heart failure in the study that are similar to those observed in other studies.

Given the strong signals of thromboembolic events, here are the Kaplan-Meier curves of all thromboembolic adverse events for the NDD population on the left and DD population on the right. These analyses are based on on-study assessment window.

The curves in the NDD population are

difficult to interpret because of the marked

differences in subject retention between the two

groups. For the DD population, however, time at

risk was similar in both groups, and about

90 percent of patients were on hemodialysis with

vascular access. Roxadustat risk of thromboembolic

FDA CRDAC July 15 2021 158

events versus ESA is quite clear in this population. The log-rank test show nominally statistically significant results for both analyses.

Vascular access is the lifeline for hemodialysis patients. Here are the Kaplan-Meier curves for device and shunt thrombosis in the DD population. These analyses are based on the on-study ascertainment window. On the left, the figure shows all of these adverse events for serious and non-serious. On the right, only the serious events are shown.

They both show events through 36 months or 3 years. I will remind you that the absolute risk difference for all of these events was 2.1 events per 100 patient-years, and for serious adverse events, it was 1.1 event per 100 patient-years.

The vast majority of patients who developed serious events of device/shunt thrombosis required hospitalization and placement of a new vascular access.

Now, Dr. Song will present the MACE results.

July 15 2021

Presentation - Jae Joon Song

DR. SONG: Good afternoon. My name is

Dr. Jae Joon Song, and I am a statistical reviewer

in the Office of Biostatistics. In this

presentation, I'm going to discuss the

cardiovascular safety analysis and results. I will

also explain the differences and implications of

using on-treatment and on-study analysis.

In the cardiovascular safety evaluation,

MACE was defined as a composite of all-cause

mortality, non-fatal myocardial infarction, and

non-fatal stroke. Study endpoints were adjudicated

by an independent clinical endpoint committee whose

members were blinded to treatment assignment.

One of the key analytical considerations was how the MACE event will be counted with respect to the exposure to treatment. An ascertainment window defines period of time for which a subject is at risk of the event and determines which events will be considered in analysis.

For the MACE analysis, we considered two windows, on treatment plus 7 days, or OT plus 7,

FDA CRDAC July 15 2021 160

and on-study analysis. The two ascertainment windows can have different implications on the interpretation of results. In the following slide, I will explain the definition and differences in these two approaches to set the stage for discussing the MACE results from the roxadustat trials.

A key issue in the assessment of safety in the roxadustat program is when a safety event occurs relative to exposure to treatment. This slide includes an illustration of hypothetical subjects and time they're being followed in a trial.

The green line depicts a time a subject is exposed to randomize treatment. The gray line depicts the ascertainment window after treatment exposure, which in this program was commonly defined as 7 or 28 days. The dash line depicts time while a subject was off treatment but still being followed for the event of interest.

Events are depicted with red diamonds. As mentioned, the assessment of MACE used two exposure

FDA CRDAC July 15 2021 161

windows. What is depicted here is the OT-plus-7 analysis, which includes only events that occur within or prior to the end of the ascertainment window. Subjects not experiencing event within this time frame are censored at the end of the ascertainment window.

For the previous hypothetical example, only two events were contributed to the OT-plus-7 analysis. As shown in the illustration, the on-treatment or the OT-plus-7 analysis estimates risk of MACE in patients assigned to roxadustat while receiving the assigned treatment.

This slide depicts the on-study analysis.

In such an analysis, all events are included regardless of exposure to treatment. Subjects not experiencing an event are censored at the date of last contact. Per our hypothetical scenario, you can see two additional events contribute to the on-study analysis relative to the on-treatment analysis.

As shown in the illustration, the on-study analysis, or the treatment policy analysis,

FDA CRDAC July 15 2021

estimates the risk of MACE in patients randomized to roxadustat versus control regardless of treatment adherence, discontinuation, or use of alternative therapies.

Having introduced the concept of
on treatment versus on-study analysis, I now will
discuss how these analyses estimate two different
risks. In the interpretation of the estimates of
risk observed in the roxadustat development
program, it is important to understand the pros and
cons of the two analysis approaches, which I will
discuss in the next set of slides.

The first estimate which I discussed is on treatment, which estimates the risk of MACE while receiving the assigned treatment. In general, there is increased sensitivity to see drug effects with the on-treatment estimate if drug attributable risk only occurs while a subject is exposed to randomize treatment. However, the on-treatment analysis can be difficult to interpret when there is considerable disparity between treatment arms on how long subjects remain on treatment.

FDA CRDAC July 15 2021 163

In other words, if there is differential treatment discontinuation between the treatment arms and if there's a reason to suspect that the differences might be related to the outcome of interest, then there is potential for obtaining a biased estimate. Finally, the on-treatment analysis is also not suitable for assessing risk and outcomes expected to have long latency.

Now for the on-study analysis, this estimate may be important if the control arm receives a reasonable representation of current standard of care. In this setting, the treatment policy approach can help assess what might happen to the target population with respect to the outcome if the investigational product is approved for marketing. Also, the on-study approach may provide greater sensitivity to adverse effects and outcomes with potentially long latency periods such as malignancy.

However, the on-study approach can be less sensitive to identifying drug attributable risk when outcomes occur after treatment

FDA CRDAC July 15 2021 164

discontinuation, and this can be especially concerning in the noninferiority settings because with more unexposed time, the on-study analysis is more likely to show noninferiority. Moreover, in the presence of a rescue therapy, the unexposed time to plan treatment can include exposures to rescue therapies, which might impact the comparisons of risks.

Finally, the quality of the on-study analysis relies on how well subjects were followed up, so there can be interpretability issues when there are systematic differences between treatment arms and follow-up time.

In the assessment of MACE in all-cause mortality you will see that results depend on how the data were analyzed, and specifically whether the time of observation was limited to time on treatment or extended to last contact. It is important to consider these pros and cons of the analysis when interpreting the safety results.

As shown earlier in Dr. Ayache's presentation, overall in the NDD trials, subjects

July 15 2021

165

in the placebo arm tended to discontinue treatment 1 Notable in this Kaplan-Meier plot is a 2 early. period after randomization to week 52 where 3 subjects randomized to placebo arm appeared to have 4 discontinued treatment in a more rapid pace 5 compared to roxadustat. Such differential 6 7 treatment duration poses a challenge in the interpretation of the on-treatment analysis. 8 Specifically, the risk estimated using the 9 OT-plus-7 (analysis) might be biased, (for example, if 10 the patient on the placebo arm, who are at greater 11 underlying risk of MACE, tend to discontinue 12 treatment early. In the DD trials, overall there 13 14 were more roxadustat subjects who discontinued treatment early, however, the discontinuation pace 15 was roughly constant shortly after randomization. 16 I will now describe the methodology used to 17 18 analyze MACE. The objectives of the MACE analysis 19 were to demonstrate noninferiority in CV risk of roxadustat compared with placebo in the NDD 20 21 population. In the DD population, the objectives of the MACE analysis were to demonstrate 22

July 15 2021

166

noninferiority and CV risk of roxadustat compared 1 to ESAs. 2 I'll note the applicant and FDA did not 3 agree prospectively on a risk margin. Furthermore, 4 we do not agree with the applicant's proposed 5 margin of (1.3, as (it) was defined after results of 6 7 the study were known. Therefore, FDA does not agree on the interpretation of the results using 8 strictly a noninferiority hypothesis testing 9 approach. Rather, our interpretation of the trial 10 findings focuses on the estimation of MACE risk and 11 the uncertainty around it. 12 Such statistical inference appear to be 13 14 appropriate because the development programs for both populations were sufficiently large to observe 15 a meaningful number of CV events to estimate the 16 risk, and the definition and data capture of the 17 18 outcomes was of high quality. 19 For evaluation of CD safety in the NDD population, three phase 3 randomized, double-blind, 20 21 placebo-controlled trials were prospectively agreed upon. In addition, there were three phase 3 22

July 15 2021

randomized open-label ESA-controlled trials that were prospectively agreed upon for evaluation of safety in the DD population.

The primary analysis for the NDD population was on-study with a sensitivity analysis performed as an on-treatment analysis. For each trial, Cox regression was used to model the treatment effect using prespecified trial-specific stratification factors. Hazard ratios from each trial were combined using weight inversely proportional to the variance of the study-specific log hazard ratio estimates.

The primary analysis for the DD population was on treatment with a sensitivity analysis performed as on-study analysis. Similar to the meta-analysis for the NDD population, Cox regression was used to model the treatment effect for each trial using prespecified, trial-specific stratification factors. The overall hazard ratio estimate was obtained using a meta-analysis technique that's previously described for the NDD population.

18

19

20

21

22

July 15 2021

168

Now I will provide a summary of the MACE analysis results in the in NDD population. Presented in this slide are Kaplan-Meier curves for the analysis of MACE in the NDD population. In the primary on-study analysis, the hazard ratio comparing the risk of MACE between roxadustat and placebo was 1.1 with a 95 percent confidence interval that ranged from 0.96 to 1.27. There was considerable difference in the hazard ratio estimate using on-treatment or OT-plus-7 analysis, with a hazard ratio of 1.38 and a 95 percent confidence interval that ranged from 1.1 to 1.7. Results for components of MACE is presented in this table for the on-study and all OT-plus-7 analyses. As you can see, most of the MACE events were driven by all-cause mortality, which I will discuss in more detail in a later section. In the ESA control trial 610, not considered for the meta-analysis, the estimated hazard ratio comparing roxadustat to darbepoetin alfa in the on-study analysis was 0.89 with a 95 percent

FDA CRDAC July 15 2021

confidence interval that ranged from point 0.6 to 1.3. In the OT-plus-7 analysis, the hazard ratio was 0.7 with a 95 percent confidence interval that ranged from 0.44 to 1.2.

In summary, there was considerable difference between the estimated hazard ratios for the primary on-study analysis and the OT-plus-7 sensitivity analysis. In the NDD population, the treatment policy analysis results suggest no significant difference in the risk of MACE relative to placebo. On the other hand, the results from the on-treatment or the OT-plus-7 analysis suggest an increased risk of MACE for the roxadustat arm compared to placebo.

Although the 95 percent confidence interval for the OT-plus-7 analysis merits concern, the differential exposure between roxadustat and placebo complicates the interpretation of the OT-plus-7 analysis in isolation, as this may not represent a fair randomized comparison.

Now I will provide a summary of the MACE analysis results in the DD population. In the

FDA CRDAC July 15 2021 170

primary on-treatment or OT-plus-7 analysis, the hazard ratio comparing the risk of MACE between roxadustat and ESA was approximately 1 with a 95 percent confidence interval for the estimate, ranging from 0.88 to 1.2.

On the other hand, the on-study analysis indicated a higher risk of MACE in subjects randomized to roxadustat, with a hazard ratio of 1.14 and an upper bound of the 95 percent confidence interval 1.3.

Results for the components of MACE are presented in this table for both OT-plus-7 and on-study analysis. As you can see, a majority of MACE events were driven by all-cause mortality, which I will discuss in more detail in a later section.

In the ESA-controlled trial 613, not considered for meta-analysis, the estimated hazard ratio comparing roxadustat to ESAs were 1.29 in the OT-plus-7 analysis, with a 95 percent confidence interval that ranged from 0.91 1.85. The on-study analysis suggested an increased risk of MACE, with

July 15 2021

a hazard ratio of 1.39 and a 95 percent confidence interval that ranged from 1.01 to 1.91.

In summary, in the DD population, results suggested no significant difference in the risk of MACE while subjects were receiving the assigned treatment. However, the on-study analysis suggests an increased risk of MACE relative to ESA, and the direction of such risk was also consistent in a trial that was not considered for meta-analysis.

As discussed earlier in my presentation, it is important to remember that on-study analysis represents an estimate of the treatment policy principle that compares the risk regardless of treatment adherence, discontinuation, or use of alternative therapy.

Now I will provide a summary of the all-cause mortality analysis results in the DD population. In the on-study analysis, the hazard ratio comparing the risk of all-cause mortality in subjects randomized to roxadustat compared to placebo was 1.08 and the 95 percent confidence interval ranged from 0.93 to 1.26.

14

15

16

17

18

19

20

21

22

July 15 2021

172

There was considerable difference in the hazard ratio estimated using an OT-plus-7 analysis, with a hazard ratio 1.40 and the 95 percent confidence interval that ranged from 1.08 to 1.82. Causes of death were adjudicated by an independent event committee. In the OT-plus-7 analysis, fewer than half of deaths were cardiovascular in nature. Overall, the leading causes of death were infections, renal death, and sudden cardiac death. In the ESA-controlled trial 610, not considered for meta-analysis, hazard ratios comparing the risk of death between subjects randomized to roxadustat and darbepoetin alfa were 0.94 and 0.67, respectively, for on-study and on treatment plus 7 analysis. However, the number of deaths were considerably smaller in the meta-analysis, which results in more uncertainty in the risk estimates. Now I will provide a summary of the all-cause mortality analysis results in the DD population. In the on-study analysis, the results suggested higher risk of all-cause

July 15 2021

mortality relative to epoetin alfa, with a hazard ratio of 1.17 and the 95 percent confidence interval that ranged 1.02 to 1.35. On the other hand, in the OT-plus-7 analysis, the hazard ratio for comparing the risk of all-cause mortality between roxadustat and epoetin alfa was 1.02 and the 95 percent confidence interval that ranged from 0.85 to 1.23.

More than half of the deaths were

More than half of the deaths were cardiovascular related. The leading causes of cardiovascular death were acute MI and sudden cardiac death. The leading non-cardiovascular causes of death were infections and renal death.

In trial 613 that was not considered for meta-analysis, the risk of all-cause mortality appeared to be higher for the roxadustat arm compared to ESAs. The estimated hazard ratio comparing roxadustat to ESAs in the on-study analysis was 1.54 with a 95 percent confidence interval that ranged from 1.09 to 2.16. In the OT-plus-7 analysis, the estimated hazard ratio was 1.54 with a 95 percent confidence interval that

FDA CRDAC July 15 2021 174

ranged from 1.04 to 2.28.

Now Dr. Ayache will provide a summary of analyses exploring the relationships between thromboembolic events, roxadustat dose, hemoglobin, and hemoglobin rate of change.

Presentation - Saleh Ayache

DR. AYACHE: This slide illustrates the relationship between thrombotic events and overall weight adjusted roxadustat dose. The mean, study drug dose was calculated for each subject in the pooled analyses and subjects were arranged in quintiles on the basis of total dose and treatment group.

For these slides, Q1 represents the lowest quintile and Q5 is the highest. The number of thromboembolic events were calculated for each dose quintile and expressed as percent of subjects with events. The number inside the bars represent the numbers of events. The black bars are roxadustat and the open bars are the comparators. Analysis for the NDD and DD populations are shown on the left and right, respectively.

July 15 2021

We see weak association between the total weight adjusted roxadustat dose and probability of thromboembolic events. There is no clear association in subjects who receive ESA. Given that the doses of study agents were titrated and changed throughout the study, it makes more sense to assess thrombosis rate on the basis of the drug doses received at the onset of the event.

This slide illustrates this relationship for the NDD on the left and DD population on the right.

This figure suggests a fairly strong association between the roxadustat dose and thrombotic events, but no association in the placebo-treated patients.

The right figure for the DD population shows a reasonable association for subjects who received roxadustat but no clear association for subjects who received ESA. An important point should be made here. Because the doses were titrated based on the hemoglobin response, the analysis is confounded by responsiveness. In other words, the doses tended to be increased to a greater extent in subjects who were poorly responsive to the drug.

19

20

21

22

July 15 2021

176

Thus, the bars in the higher quintile -- Q3, Q4, and Q5 -- includes disproportionately more subjects who were poorly responsive to the drug. Such patients have more advanced kidney disease as well as a greater burden of concomitant diseases. As such, there were a greater risk of cardiovascular and thrombotic events. It's not possible to separate these factors. Here you see the relationship between the thromboembolic events and hemoglobin in the NDD population on the left and the DD population on the Hemoglobin values were estimated for all subjects for all weeks in treatment and patient-weeks were based in quintiles on the basis of hemoglobin concentration separately by treatment arm. The numbers of thromboembolic events were assessed for each quintile for both treatment arms and expressed as a rate per 52 patient-weeks. Q1 represents the lowest quintile and Q5 is the highest.

A number of prior studies have suggested

July 15 2021

that subjects with lower hemoglobin values are at a higher risk of cardiovascular events, and such an association was observed here as well. The question always arises as to whether the higher risk is related to the lower hemoglobin values per se, or whether lower hemoglobin is a marker of more advanced kidney disease and more concomitant disease, which renders patients less responsive to hemoglobin stimulating drugs are more likely to experience adverse events. It's not possible to separate these factors easily.

This slide illustrates the relationship between thromboembolic events and hemoglobin rate of rise. The hemoglobin rate of rise was estimated for each week that each patient was on treatment by fitting a linear regression line through the hemoglobin values obtained during the preceding 4 weeks.

Patient-weeks were placed in quintiles.

Adverse events were tabulated for each quintile for both treatment arms and results are expressed, thrombotic events per 52 patient-weeks. Q1

July 15 2021

represents the lowest quintile and Q5 is the highest.

Note that the numbers of the events are very small, particularly on the left figure. The numbers are limited because a slope could not be calculated for many patients-weeks. Nevertheless, in both populations there are apparent associations between thrombotic events and hemoglobin rate of rise.

Such associations were also found in the darbepoetin alfa development program. While the analysis I just displayed showing thrombotic events versus hemoglobin concentration was confounded by responsiveness, this analysis is not.

Specifically, patients who are more responsive to these drugs tend to achieve higher rates of hemoglobin rise, and one might reasonably ask whether these thrombotic events tended to occur near the beginning of the studies when the hemoglobin tended to rise most rapidly.

However, the Kaplan-Meier curves shown in slide 44 show that these thrombotic events tended

FDA CRDAC July 15 2021

to occur throughout these studies and not mostly at the beginning. Although these data are not conclusive, it's possible that limiting hemoglobin rate of rise could decrease the incidence of thromboembolic events.

In summary, the clinical trials in NDD and DD populations showed that roxadustat is effective in increasing the hemoglobin level. Exploratory analyses show an absolute reduction of RBC transfusion of approximately 10 percent compared to placebo.

Roxadustat is administered orally, which may offer an advantage over ESAs, which are administered IV or SubQ. If such an advantage exists, it would be for patients who do not receive hemodialysis. Importantly however, hemoglobin intended to overshoot target in the NDD population and in Study 613, and its relation to risk is uncertain.

The risk of MACE and all-cause mortality are difficult to interpret. The primary analyses were neutral when comparing roxadustat to placebo in the

FDA CRDAC July 15 2021

NDD population and roxadustat to ESA in the DD population, however, the sensitivity analyses in both populations were unfavorable for roxadustat.

There are higher risks for roxadustat than both placebo in the NDD population and epoetin alfa in the DD population for thrombosis, vascular access thrombosis, and seizure. There appears to be higher risk than placebo in the NDD population and a similar risk to epoetin alfa in the DD population for myocardial infarction, stroke, and systemic hypertension. Also, there appears higher risk of serious and fatal infections than placebo in the in NDD population.

This concludes our talk. Thank you for your attention.

Clarifying Questions

DR. LEWIS: We will now take clarifying questions for FDA. Please use the raised-hand icon to indicate that you have a question and remember to put your hand down if you have asked your question.

When acknowledged, please remember to state

July 15 2021

181

your name for the record before you speak and 1 direct your question to a specific presenter, if 2 If you wish for a specific slide to be 3 displayed, please let us know the slide number, if 4 possible. Finally, it would helpful to acknowledge 5 the end of your question with a thank you and the 6 end of your follow-up question with, "That is all 7 for my question," so we can move on to the next 8 9 panel member. 10 I will reserve the unasked clarifying questions for the sponsor for later, so this now 11 opens the clarifying questions for the FDA. 12 Mr. Conway? 13 14 (No response.) DR. LEWIS: Mr. Conway, you may be on mute. 15 MR. CONWAY: Thank you very much; a general 16 question for FDA. 17 18 I've had a concern in looking at the data in 19 the summary, which I think was very detailed, about pooled data in general. Can you tell me for 20 21 first-in-class drug consideration, how common is that? And for this particular set of data, the 22

July 15 2021

182

```
pooling, is that common or was this novel in
1
     putting it together like this? Either presenter;
2
                  That's my question.
3
      thank you.
4
             DR. LEWIS: FDA?
              (No response.)
5
             DR. LEWIS: Do one of the FDA speakers, or
6
7
     another member of the FDA present, want to answer
      that question?
8
             DR. YU: Could Dr. Song answer the question?
9
             DR. LEWIS: Dr. Song, you may need to
10
     unmute.
11
                        This is Dr. Song, FDA.
12
             DR. SONG:
     MACE analysis, actually the data weren't pooled.
13
     The hazard ratios estimated at each trial level
14
     were combined using a meta-analysis technique.
15
                                                       As
      for the MACE analysis and all-cause mortality
16
      analysis, the hazard ratio estimates were based on
17
18
     meta-analysis.
19
             MR. CONWAY:
                          Thank you.
             DR. LEWIS: Did that answer your question,
20
21
     Mr. Conway? Because I think the question is for
      first-in-class drugs; do you do this with pooling
22
```

July 15 2021

183

```
data or one defining study, looking at
1
     cardiovascular safety? For example, MPEG reg [ph],
2
     which is more common.
3
              (No response.)
4
             DR. LEWIS: Dr. Song?
5
              (No response.)
6
7
             DR. LEWIS: Does any member of the FDA want
      to further comment?
8
9
             DR. UNGER: Yes. This is Dr. Unger.
      jump in. I think the question, if I interpreted it
10
      correctly, was more about the standard safety
11
12
      analyses.
                 I think the answer is this was quite a
     wide and deep development program.
                                           It's not
13
14
      typical that we get six trials, or more, to support
      the efficacy and safety of a drug.
15
             But when we get trials that are similar in
16
      design, for any indication, for safety analyses, we
17
18
      do tend to pool. We tend to use simple pooling
19
     when we can.
                    So it's not unusual for a development
     program to have this many trials, but it's somewhat
20
21
     unusual to have a development program that has this
     many trials. I hope I've answered your question.
22
```

July 15 2021

184

MR. CONWAY: You have. Thank you very much. 1 DR. LEWIS: Thank you, Dr. Ellis. 2 Dr. Cho? 3 DR. CHO: Yes. This is Leslie Cho. Thank 4 you for the nice analysis, and two questions for 5 the FDA. 6 One is, as far as all the roxadustat 7 studies, it appears that they've excluded patients 8 with history of cancer, especially hematological 9 cancer, and then they've excluded patients unless 10 they were cancer-free for 5 years. 11 Is this correct? 12 DR. FARRELL: Yes, some of those. I'd like 13 14 to refer, though, the question to the sponsor because they have a significant database in many 15 countries. 16 DR. LEWIS: Okay. 17 18 DR. CHO: And then my second question is, 19 there was a lot of mention from the sponsors regarding hyporesponse to the epo, to the ESA 20 21 class. Is there any data from the sponsor regarding the hyporesponders' response to their 22

FDA CRDAC July 15 2021 185

drug? 1 DR. LEWIS: I quess those two questions are 2 actually to the sponsor; is that correct? 3 I'll let the sponsor answer. 4 DR. EISNER: Dr. Lewis, it's Mark Eisner. 5 Do you want us to address those questions now or 6 later? 7 DR. LEWIS: Yes, you can do it now since we 8 asked them right now. 9 DR. EISNER: Okay. Let me ask Dr. Little to 10 address your question about history of cancer, and 11 12 then Dr. Szczech to answer the question about hyporesponse. 13 DR. LITTLE: Dustin Little here. 14 Dr. Cho, across the program, in general, 15 patients with a history of prostate cancer, breast 16 cancer, or other malignancies were excluded with 17 18 the exceptions of cancers determined to be cured or 19 in remission for five or more years, or curatively resected basal cell or squamous cell cancers, 20 21 cervical cancer in situ, or resected colonic polyps. 22

FDA CRDAC July

July 15 2021

186

DR. CHO: But all hematological cancers 1 appears to be one of the contra-exclusion criteria 2 is that correct? 3 DR. LITTLE: Yes, that would have been 4 considered an exclusionary Criterion. 5 DR. CHO: And the reason I ask is because I 6 am concerned about the increased rate of thrombosis 7 seen. And it may not be related to the rise of 8 hemoglobin but may be related to the class of drug 9 10 itself, and that is the reason for the question. Thank you. 11 12 DR. LEWIS: Thank you. Dr. Moliterno? 13 14 DR. MOLITERNO: Thank you, Dr. Lewis. if you want to deem this question better for later, 15 that's fine because it's concerning a little bit of 16 the question I had earlier. 17 18 For the sponsors or to the FDA, I think many of us on the call understand the foundational 19 concepts of pros and cons we're considering, but 20 what I haven't heard much discussion from either 21 side so far is this risk mitigation modeling and 22

July 15 2021

187

```
potential statistical shortfalls with some of the,
1
      I guess, assumptions or speculations.
2
             So I'm wondering if now or later, Dr. Song,
3
     Ayache, or perhaps Dr. Unger, want to make any
4
      comments, or if we want to wait until later.
5
             DR. LEWIS: I think those questions can be
6
7
      answered by the FDA now.
             DR. UNGER: This is Dr. Unger. In terms of
8
     both changing the paradigm for dosing and in terms
9
      of the proposal for a postmarketing study, those
10
     were put on the table by the applicant fairly
11
12
      recently, and we have not had a chance to discuss
      them or analyze them. So they are not something we
13
14
      can discuss. Thank you.
             DR. LEWIS:
                          Thank you. It's something maybe
15
     we can discuss in the discussion section.
16
             DR. MOLITERNO: Yes. I agree completely.
17
18
             And just maybe a clarifying question, not to
19
      that one; but is it correct that mortality data or
      long-term survivorship was missing in roughly
20
21
      10 percent of the population studied?
                         That's a question for the FDA?
22
             DR. LEWIS:
```

July 15 2021

188

DR. MOLITERNO: Well, the FDA didn't comment 1 on it, except in the very early part, but they 2 didn't address it specifically. I'm happy to have 3 either side, any concerns. I appreciate that it 4 was balanced between the groups, but it seems like 5 there was around 10 percent missing data for 6 mortality or survivorship, which is quite 7 surprising given the illness of this cohort. 8 DR. FARRELL: This is Dr. Farrell. 9 Would the applicant please respond to the 10 question? 11 DR. EISNER: Yes. Let me ask Dr. Little to 12 respond to your question about the follow-up 13 completeness for all-cause mortality. 14 Dr. Little? 15 DR. LITTLE: Dustin Little. We did have 16 91 percent of patients complete follow-up for 17 18 all-cause mortality in the NDD pool and 91 to 19 92 percent of patients completed follow-up for all-cause mortality in the DD pool. 20 21 If I may, I'd like to take just 20 seconds and then show a quick comparison of how the 22

July 15 2021

189

```
treatment completion and study completion rates in
1
     our trials compare to CKD anemia trials that came
2
     before us.
3
             On the left is percent of patients with
4
      treatment completion, and roxadustat is the yellow
5
      dots, and then on the right is percent of patients
6
     with study completion. Perhaps due to the high
7
      comorbidity in these patients, historically, the
8
     retention rates are lower than cardiovascular
9
      safety trials in other outcomes, and in general we
10
     had comparable rates of treatment and study
11
     completion compared to the trials that came before
12
13
     us.
14
             DR. LEWIS:
                          Thank you.
             Dr. O'Connor?
15
              (No response.)
16
             DR. LEWIS: Dr. O'Connor, you may be on
17
18
     mute.
             I actually don't see him on our list, so
19
     we'll go on to Dr. Wang and come back to
      Dr. O'Connor.
20
21
             Dr. Wang?
             DR. WANG: Yes. Thank you.
22
                                            The FDA
```

July 15 2021

speakers nicely showed how the results differ by ascertainment interval, which I know would be a subject of a lot of conversation.

If the FDA speaker could clarify, what was marked as the primary analysis differed in the NDD versus DD populations with the on-study interval chosen for the NDD population but the on-treatment plus 7 chosen for the DD.

Was that decision made by the FDA, was it made in discussion with the sponsor, or was it proposed by the sponsor and approved by the FDA?

And secondly, was the timing of that decision at a point in time when the data had already been acquired or was it prespecified?

DR. FARRELL: This is Dr. Farrell. These were discussed with the sponsor during the various sponsor meetings that we have had. Some of it had to do with when we thought for the dialysis population they would likely need to go back on to an ESA once roxadustat was stopped. So those were some of the considerations.

Does this answer your question?

July 15 2021

191

DR. WANG: Well, if I could follow up; so 1 that was not fully discussed? It sounds like that 2 was an ongoing dialogue. I guess secondly, if you 3 could just clarify, why was a different interval 4 chosen for the NDD versus DD populations? 5 DR. FARRELL: Most of the conversations 6 7 occurred pre-data --DR. WANG: Okay. 8 9 DR. FARRELL: -- pre-data. And again, it was a consideration about one patient on dialysis 10 would be likely needing to start therapy. 11 also based on what we had seen in the Omontys 12 program, as well as TREAT and CHOIR. 13 14 These conversations were a long time ago, and I would ask the sponsor if they have a better 15 recollection of why some of the time points were 16 chosen. 17 18 DR. EISNER: Yes. Mark Eisner. If I may, 19 we agree with you, Dr. Farrell. The primary analysis for NDD and MACE was the on-study or 20 21 intention-to-treat analysis to take care of the bias introduced by informative censoring. And for 22

July 15 2021

192

```
the dialysis-dependent population, we both agreed
1
      that the OT7 was a preferred window for the reasons
2
     you stated about switching to ESA after
3
4
     discontinuation of roxadustat.
             DR. WANG:
                        Thank you.
5
             DR. LEWIS: Dr. Thadhani?
6
             DR. THADHANI: Dr. Lewis, my question was
7
      identical to the previous one from Dr. Wang.
                                                     Thank
8
9
     you, Dr. Lewis.
10
             DR. LEWIS:
                          Okay. Ms. Alikhaani?
             MS. ALIKHAANI: Yes. Jacqueline Alikhaani
11
             I don't know if this question was answered
12
     before, but it's really for the sponsor.
13
     wanted to get a little information about the reason
14
      that the data was not generated showing that
15
     patients that are hyporesponsive to ESAs are
16
      responsive to roxadustat.
17
18
             So I don't know if I missed that
19
      information, but can the sponsor answer that for me
     now?
20
21
             DR. EISNER: Yes. Thanks. It's Mark
     Eisner. I'll ask Dr. Szczech to address your
22
```

July 15 2021

193

question about hyporesponsiveness to ESA and the 1 role for roxadustat. 2 Dr. Szczech? 3 DR. SZCZECH: Thank you very much. 4 I hope that the slide that I just asked 5 Szczech. to be pulled up will be pulled up. 6 7 During the presentation, we presented data on CRP, ferritin, and hepcidin as present in your 8 briefing book, looking at the mechanistic causes of 9 hyporesponsive. But anticipating your question 10 about who were hyporesponsive at baseline, we can 11 go to the stable dialysis population, those 12 patients that converted from ESA to roxadustat, and 13 14 look at the relative hierarchy of their responsiveness as they made that conversion. 15 So yes, this slide is up. I just did a 16 quick technical check. On the left, you see 17 18 patients treated with ESA; on the right, you see 19 patients treated with roxadustat. The patients in this slide were selected because they converted 20 21 from one trial to another, therefore allowing us to make this comparison. 22

194

We stratified on baseline hemoglobin, which is one of the criteria for hyporesponsive, that you don't get the response that you want, therefore, your hemoglobin is not as high as you'd like it to As you look from left to right in the graph on be. the left of ESA-treated patients, the hierarchy remains; that those patients who were less responsive at baseline, everyone regressed toward the mean, which we know that inflammation does go away when it's related to a short term condition, but the hierarchy of the people that were most responsive and the people that were less responsive remained the same. On the right, you can see the roxadustat-treated patients where they had similar quartiles of responsiveness at baseline due to randomization, but as they were treated with roxadustat, that hierarchy of the blue quartile, being less responsive, no longer remained. Those patients disappeared into the mean of that population, meaning that whatever conferred that

hyporesponsiveness likely was not a factor in

July 15 2021

195

```
roxadustat responsiveness.
1
             MS. ALIKHAANI: Thank you.
2
             DR. LEWIS: Dr. O'Connor?
3
             DR. O'CONNOR: I quess I'm back. Chris
4
      O'Connor; a question for Dr. Unger. There was a
5
     statement (that the boundary of the upper limit of
6
7
     confidence, 0.4, was chosen by the sponsor after
     the blind was broken as 1.3. What would have been
8
9
     your recommendation prior to blind breaking for
     that guidance of the upper limit confidence
10
     interval boundary, based on the large number of
11
     events in these pooled trials?
12
             DR. UNGER: This is Dr. Unger.
13
14
             Thanks, Dr. O'Connor. Well, first of all, I
     wasn't involved in the discussions because this
15
     division wasn't within my office at the time.
16
     Second of all, we all know that, 1.3, these limits
17
18
     are arbitrary. A 1.3 is reasonable. It was used
19
     in the diabetes guidance. It's hard for me to say
     what I might have done, especially now that we have
20
21
     the data in front of us; so it's not a great
22
     answer.
```

July 15 2021

196

```
DR. FARRELL: This is Dr. Farrell. I was
1
     involved in the negotiations, and after the TREAT
2
3
     trial and dealing with Omontys, we had a goal of
     1.25, and that's what we discussed during meetings.
4
     So that's why there was not an agreement on 1.3,
5
     and I agree with everything that Dr. Unger has said
6
7
     regarding it's somewhat arbitrary.
             DR. LEWIS: Dr. O'Connor, does that address
8
9
     your question?
             DR. O'CONNOR: Yes.
10
             DR. LEWIS:
                          Thank you.
11
             I will move on to David Soergel.
12
             DR. SOERGEL: Thanks. David Soergel. I
13
14
     have a question for Dr. Ayache about Study 610.
     And specifically I'm curious about the baseline
15
     characteristics in that study that may have
16
      contributed to some of the findings that were
17
18
      shown, and that might also be a question for the
19
      sponsor.
             DR. FARRELL: Dr. Ayache?
20
21
             What slide, Doctor, would you like to see up
      for 610, or would you rather hear from the sponsor?
22
```

FDA CRDAC July 15 2021

197

DR. SOERGEL: Let me find it for you. 1 DR. AYACHE: On 610, I will defer this to 2 the sponsor because this study was conducted 3 exclusively in Europe and there was some imbalance 4 between the two arms in baseline and disease 5 characteristics. These balances are not that 6 totally significant, but also I defer it to the 7 sponsor to answer this question in more detail. 8 9 DR. EISNER: Thanks, Dr. Ayache. This is Mark Eisner. I'll ask Dr. Little to 10 speak to the baseline characteristics for 11 Study 610. 12 DR. LITTLE: Yes. Dustin Little. I'd like 13 14 to just remind everybody what Study 610 was. we bring up CO-70 just for a few seconds? 15 Study 610 was the non-alfa study with the 16 active control that's particularly relevant for our 17 18 program because it was not confounded by large differences in treatment discontinuation, and these 19 are the cardiovascular safety results. 20 21 One of the reasons that we thought that this was an important study for us to think about is 22

FDA CRDAC July 15 2021 198

because, in many respects, the patient 1 characteristics that drove the differences in 2 treatment discontinuation, the placebo-controlled 3 program, was mostly that being patients having 4 relatively low hemoglobin values and patients 5 having quite low baseline eGFR values were present 6 in this study. 7 So these patients we consider are generally 8 9 representative of the patients in the placebo control trial, and that's one of the reasons why we 10 found it so reassuring that we had the 11 cardiovascular safety results that we had in this 12 study. 13 14 DR. LEWIS: Thank you. I will now turn to our leftover questions 15 for the sponsor from earlier, clarifying questions. 16 Dr. Crowley, do you still have a question? 17 18 DR. CROWLEY: Yes. Thank you. This is for 19 Dr. Little or a representative from FibroGen. In terms of your risk mitigation strategy, I 20 21 was wondering if you had considered inclusion, say, of a moratorium period for people who have had a 22

July 15 2021

199

recent seizure, or a recent myocardial infarction 1 and a DVT; also in terms of risk mitigation, 2 caution in the use of patients not only who have a 3 history of seizure but have a history of 4 hypercoagulability. I don't know if they were also 5 that cohort of patients who were excluded from the 6 trials as well. 7 DR. EISNER: Mark Eisner here. Thanks for 8 the question. I will refer it to Dr. Little to 9 respond. 10 Dr. Little? 11 DR. LITTLE: Dustin Little. The first part 12 of the question I believe had to do with inclusion 13 criteria, consideration of the types of patients to 14 include in the postmarketing study. We're 15 certainly willing to consider and thinking through 16 some of the details of that study. 17 18 I think probably we would consider taking a 19 similar approach to the approach that we took in the clinical program, where we did not exclude 20 21 patients with a history of thrombosis, but rather patients with a thrombotic event within the last 22

July 15 2021

200

So I would anticipate that that would be 1 12 weeks. an approach that we would strongly consider. 2 DR. CROWLEY: Then may I also ask you, is 3 there anything that we can learn already from the 4 dosing practices in China and Japan since this 5 medication has been approved already in those 6 countries? Is it typical practice to reduce the 7 doses and to slow the rate of rise of hemoglobin? 8 DR. EISNER: Let me ask Dr. Little to 9 comment at a high level on the safety data. 10 we're talking safety data from China and Japan, I 11 think that will be a lot straighter than -- just to 12 get very specific about dosing practices. 13 14 They are different. The starting doses are a bit different in the two different regions, which 15 does make it a little bit hard to compare apples to 16 apples. For example, the starting doses in China 17 18 are actually slightly higher than they were in the 19 global program. But, Dr. Little, can you just speak at the 20 21 high level about the postmarketing safety data? DR. LITTLE: Yes. Dustin Little. I'd 22

time.

July 15 2021

201

actually like to briefly show data that pertains to the question. On the left, we have the number of vascular access thrombosis, deep vein thrombosis, and pulmonary embolism events that have been reported in China and Japan with the reporting rate per 100 patient-years compared to the combined incidence rate from the China and Japan studies. The first thing that I'd like to point out is that in the studies in China and Japan, although they were not as large as those in our pooled program, the rates of thrombosis did appear to be quite a bit lower. It may be that patients in those regions have different risks of thrombosis. Then I'd also like to point out that the reporting rates together between China and Japan are lower than the rates that we saw in the clinical trials in that region. DR. LEWIS: Okay. Dr. Cho, do you still have a question? will say we have a hard stop. We need time to set

up the open public hearing, and it must start on

We have four more minutes, and then we will

FDA CRDAC July 15 2021

202

only have a 45-minute lunch. 1 Dr. Cho, do you still have a question for 2 3 the sponsor? DR. CHO: Yes. I have one question. Leslie 4 Cho. 5 Your postmarketing study, in your regular 6 studies for the FDA approval, patients who had MI, 7 it seems that they were excluded for -- if they had 8 it within the year, they were excluded, but your 9 postmarketing study has 12 weeks. 10 Am I confused? Am I wrong? 11 DR. EISNER: Dr. Little, can you please 12 address that question? 13 DR. LITTLE: Dustin Little. The exclusion 14 for myocardial infarction, acute coronary syndrome, 15 and stroke in the clinical studies was within 16 12 weeks prior to randomization. I mentioned that 17 18 that's what we would consider for the postmarketing 19 study, but of course we would plan to discuss the details with FDA. 20 21 DR. LEWIS: Dr. Moliterno, do you have a question for the sponsor remaining? 22

July 15 2021

203

```
DR. MOLITERNO: No, Dr. Lewis.
                                               Thank you
1
      for asking.
2
             DR. LEWIS: Dr. O'Connor, I see you have
3
      your hand up. I don't know. Is that for the FDA?
4
              (No audible response.)
5
             DR. LEWIS: Okay.
6
7
             Dr. Packard, do you have a question? And we
     have three minutes?
8
9
              (No response.)
             DR. LEWIS: Dr. Packer, you may be on mute.
10
             DR. PACKER: I'm okay.
11
12
             DR. LEWIS:
                          Okay, great.
             I don't know if you've had a chance to pull
13
14
     up any of the compliance data that I requested or
     you're going to do that after the break and after
15
      the open session.
16
             DR. EISNER: Dr. Lewis, we'll have that
17
18
     prepared for after the break, after the open
19
     session.
             DR. LEWIS: Great. Okay.
20
21
             So we will now break for lunch. We will
      reconvene in approximately 47 minutes at exactly
22
```

FDA CRDAC July 15 2021 205

(2:30 p.m.)

Open Public Hearing

DR. LEWIS: We will now begin the open public hearing session.

Both the FDA and the public believe in a transparent process for information gathering and decision making. To ensure such transparency at the open public hearing session of the advisory committee meeting, FDA believes that it is important to understand the context of an individual's presentation.

For this reason, FDA encourages you, the open public hearing speaker, at the beginning of your written or oral statement to advise the committee of any financial relationship that you may have with the sponsor, its product, and if known, its direct competitors. For example, this financial information may include the sponsor's payment of your travel, lodging, or other expenses in connection with your participation in the meeting.

FDA CRDAC July 15 2021 206

Likewise, FDA encourages you, at the beginning of your statement, to advise the committee if you do not have any such financial relationships. If you choose not to address this issue of financial relationships at the beginning of your statement, it will not preclude you from speaking.

The FDA and this committee place great importance in the open public hearing process. The insights and comments provided can help the agency and this committee in their consideration of the issues before them.

That said, in many instances and for many topics, there will be a variety of opinions. One of our goals for today is for this open public hearing to be conducted in a fair and open way, where every participant is listened to carefully and treated with dignity, courtesy, and respect. Therefore, please speak only when recognized by the chairperson. Thank you for your cooperation.

Speaker number 1, your audio is connected now. Will speaker number 1 begin and introduce

FDA CRDAC July 15 2021

yourself? Please state your name and any organization you are representing for the record.

DR. KUMAR: First, my name is Jayant Kumar.

I'm a nephrologist with Renal Medicine Associates

in Albuquerque, New Mexico. I am president of the

group and also the program leader for the research

program that is done at our practice.

My conflict for this presentation, it is strictly participating in phase 3 trials with roxadustat. My research site was one of the major sites in the nation for this trial. I have not received any direct honorarium, travel expenses, and I do not own any stock in this company. So with that introduction, I will start my presentation.

Again, thank you for allowing me to speak at this open forum in regards to FibroGen's program of roxadustat for management of anemia in chronic kidney disease and dialysis. As clinicians, management of anemia is one of the paramount comorbidities that we deal with on a daily basis.

Since the advent of erythropoiesis

FDA CRDAC July 15 2021 208

stimulating agents like Epogen, Aranesp, Micera, and intravenous iron, the disease state has largely been unattended and the challenge to treating anemia has not been addressed to the maximum.

We all thought that since the availability of ESAs and IV iron, we have found the holy grail, but when multiple randomized-controlled trials were presented that included normal hematocrit study for patients on dialysis, CREATE, CHOIR, and TREAT studies in CKD patients, we found that treating anemia to normal goal, which is a hemoglobin of 13 to 15, was associated with higher risk of cardiovascular mortality, as well as progression of solid tumors.

So FDA inserted a black box warning for the use ESAs. Now, the hemoglobin goal after the KDIGO guideline of 2012 has decreased to 10 to 11 grams per deciliter. While this level may be enough for some people, our patients at this high altitude in New Mexico feel the effects of anemia even at this so-called recommended goal of hemoglobin correction.

July 15 2021

My practice was one of the major sites for phase 3 clinical trials with roxadustat. provide ESRD care to more than 1100 patients in New Mexico and correspondingly a very large number of CKD-4 and CKD-5 populations. Most of our patients live at high altitudes and have multiple comorbidities due to high prevalence of diabetes. This includes a large number of Native Americans and Hispanic patients. As this was an open-label investigation, I could see the response in hemoglobin to roxadustat in our subjects. Roxadustat was able to increase and maintain hemoglobin quite well --DR. LEWIS: Dr. Kumar, your time is up. I'm We have many speakers. I apologize. sorry. DR. KUMAR: Thank you. Speaker number 2, your audio is DR. LEWIS: connected now. Will speaker number 2 begin and introduce yourself? Please state your name and any organization you are representing for the record. MS. BAKER: Hello. My name is Melissia Baker, and I am a 49-year-old proud, fourth

July 15 2021

full-time adoptive mom of a sweet 8-year-old son.

I do not have any financial disclosures regarding
my testimony today.

As a person who has lived with type 1 diabetes for close to 40 years, I became aware of my kidney disease during my early thirties. I received a transplant and fortunately did not need dialysis during my 9-month wait for a new kidney-pancreas.

The seven years with my transplanted kidney-pancreas were wonderful. I resumed a busy life as a Red Cross volunteer and human resources admin and fulfilled my lifelong dream to become a foster parent, which eventually led to my adoption story. But despite heroic efforts by my transplant team, both organs went into rejection seven years after receiving them.

I began life-sustaining hemodialysis

10 years ago while I await a second transplant. I
have a very high antibody count due to my previous
transplant and because of previous blood
transfusions. These factors make another organ

FDA CRDAC July 15 2021 211

transplant extremely difficult.

I've suffered from anemia my entire 10 years on dialysis. Even with close monitoring, my anemia can be unpredictable. I have been hospitalized because I needed blood transfusions. Those transfusions are very concerning since they contain additional antibodies. I'm already a highly sensitized transplant candidate. The anemia could make it more complicated for me to receive a second transplant.

In large part, my transplant wait time has been so lengthy due to my highly sensitized status and factors such as anemia. Anemia also makes my chronic fatigue and the low energy levels frustrating. There have been many times when my body simply cannot complete all of the tasks my brain wants to get done.

A treatment for chronic anemia would lessen my worries about future transfusions as it relates to my antigens, and a greater quality of life would help me feel more confident that I could take care of my son and be ready for transplant when the

July 15 2021

212

opportunity to receive one finally comes. 1 I remain hopeful for a healthier future. 2 The product you are reviewing today could be part 3 4 of that hope for me and so many others like me. ask you to consider that as you make your decision 5 Thank you. today. 6 DR. LEWIS: 7 Thank you. Speaker number 3, your audio is connected 8 9 Will speaker number 3 begin and introduce yourself? Please state your name and any 10 organization you are representing for the record. 11 12 MR. CARR: Hi. My name is Wyatt Carr, Sabin Wyatt Carr. I am 76 years old and I live with my 13 14 wife, Debra [ph], in California. I'm in late stage 4 CKD. I am not a statistic. I am a CKD 15 patient with seven years of real experience with 16 roxadustat. My story is like many people who 17 18 discovered they have CKD. 19 In January 2010, my cardiologist noted a trend in my red blood cell count and thought I 20 21 might have leukemia or blood cancer. He asked if I'd ever had my kidneys tested and ordered a 22

July 15 2021

24-hour GFR test. The test disclosed I was already in stage 3 kidney disease and had anemia.

According to the National Kidney Foundation,

1 in 10 of us will contract CKD and many will

discover their illness the same way I did. As a

non-dialysis CKD patient with anemia, I have been

on and off roxadustat three separate times.

First, FG-4592-041, a trial that began

August 2011 and ended on December 2011; second

FG-4592-059, a long-term trial that began on

May 30, 2012 and ended February 27, 2019 when I was
taken off due to low platelets; and third, this

April I was approved for compassionate use by the

FDA.

While I was on the drug, all the side effects were beneficial, including slowing the decline in my kidney function; more energy; lower blood pressure; improved eGFR readings; higher hemoglobin; less supplemental iron; and improved effectiveness of my statin. These improvements over the past seven years while taking roxadustat allowed me to continue to work, play golf, take

July 15 2021

walks, exercise, attend conferences, and visit companies as part of my work.

After being off of roxadustat since February 2019, I've had to have a blood transfusion in April due to severe anemia. I went from a meaningful quality of life to one where just walking from my bedroom to the living room exhausted me. My hemoglobin dropped to as low as 7.2; GFR as low as 18. I took long naps, lay on the couch most days, and was unable to do things I'd been able to do while taking roxadustat.

Due to my body's issues with inflammation, my doctors and I were concerned that I would likely be a hyporesponder to ESAs. We felt that roxadustat offered the best and possibly the only alternative. Thanks to my doctors at Kaiser, and the IRB, and the FDA, I was permitted back on roxadustat for compassionate use this March.

Again, roxadustat is having beneficial effects. All my subsequent blood tests have shown improvement. I'm extremely grateful to the doctors who helped me get access to this drug through the

July 15 2021

215

FDA's compassionate use program. I feel like it's 1 given me my life back. There are many others like 2 me who need your help from this awful chronic 3 disease. 4 Thank you, speaker number 3. 5 DR. LEWIS: MR. CARR: I beg of you to consider those 6 7 patients. Thank you. DR. LEWIS: Speaker number 4, your audio is 8 Will speaker number 4 begin and 9 connected now. 10 introduce yourself? Please state your name and any organization you are representing for the record. 11 DR. SILVA: Good afternoon. I am Dr. Arnold 12 I'm a nephrologist and director of clinical 13 research at Boise Kidney and Hypertension Institute 14 in Boise, Idaho in conjunction with Frenova Renal 15 I have served as a clinical investigator Research. 16 on studies evaluating the safety and efficacy of 17 18 roxadustat and I am not financially compensated for 19 my time today. As a physician and clinical investigator who 20 21 has participated in anemia clinical studies with multiple pharmaceutical sponsors for over 20 years, 22

July 15 2021

I am encouraged by both the efficacy of this new oral therapy to treat anemia of chronic kidney disease that has an adverse effect profile comparable to placebo. But I believe roxadustat as an oral agent offers more than a new treatment option to raise hemoglobin in kidney patients with anemia.

In the day-to-day clinical care of patients with renal disease, access to therapy poses difficulties for a patient population that often has socio-economic challenges.

Many rural areas, of which Idaho is an example, pose transportation issues for patients who must travel to medical centers that provide injectable therapies to treat anemia of chronic kidney disease. This impacts patient compliance with treatment and ultimately can adversely affect both their quality of life and clinical outcomes, and oral therapy for anemia can reduce transportation needs and the associated financial burden for many of these patients.

Moreover, in patients with end-stage kidney

July 15 2021

217

disease on renal replacement therapy, use of oral 1 roxadustat empowers patients to take a more active 2 role in the management of their anemia that can 3 have beneficial effects on both compliance with 4 treatment and their overall well-being. 5 Furthermore, oral therapies can positively impact 6 dialysis workflow in both in-center and home 7 treatment programs, and provide a smoother and more 8 efficient clinical operation. 9 Finally, study data and operations aside, 10 the positive reports from patients taking 11 roxadustat therapy, including stable hemoglobin 12 values with improved energy levels and a preference 13 for oral versus injectable therapies, suggest that 14 roxadustat be given consideration for approval as 15 an additional and important tool to treat anemia 16 chronic kidney disease. 17 18 Thank you for the opportunity to speak 19 today. Your consideration is most appreciated. DR. LEWIS: Thank you, speaker number 4. 20 21 Speaker number 5, your audio is connected Will speaker number 5 begin and introduce 22 now.

July 15 2021

218

yourself? Please state your name and any 1 organization you are representing for the record. 2 3 MS. LUEBBERS: Hi. My name is Bridget Luebbers. I am a dialysis patient, and I have no 4 financial disclosures to share. Anemia has 5 impacted my life in so many ways. When I was 6 diagnosed with kidney disease 21 years ago, the 7 first step in my treatment was to start medication 8 9 to treat my anemia. Since that day, I have battled to keep my blood levels normal. 10 Being a dialysis patient, I already struggle 11 to find energy just to complete everyday tasks like 12 showering, doing dishes, or even just brushing my 13 teeth, but when my blood count is low, it makes all 14 of these things near impossible. 15 I have had so many ups and downs with my 16 hemoglobin levels that at this point I just know 17 18 when my numbers are low. I can tell because 19 breathing becomes more difficult, walking upstairs feels like climbing a mountain, and I'm forced to 20 21 be still, lay down, and focus on my breathing because it feels like my lungs are never full. 22 My

July 15 2021

limbs become weak, it interrupts my life, and it's a huge inconvenience. I've even ended up at the point when my blood count is so low, and I'm not taking in enough oxygen that I pass out.

One particular instance of this stands out to me. It was in the middle of the night, and I woke up to use the restroom. When I stood up and took my first step, I immediately passed out and fell to the floor. After a minute, I awoke scared and in pain from the fall. The next morning I went straight to the emergency room, and upon triage, they rushed me back to see a doctor. I was as white as a ghost. They knew just from looking at me that I was severely anemic.

That resulted in a multi-day hospital stay and many units of blood transfused just to get me back to a sustainable level. I unfortunately have had many blood transfusions over the years, and as a dialysis patient hoping for a transplant, I knew transfusions were dangerous because in addition to the everyday risks of a transfusion, when you want a kidney transplant, you could end up building

July 15 2021

220

antibodies from the transfusion which would make it 1 more difficult to find a kidney match. 2 So over the past 21 years, I've had multiple 3 medications to treat my anemia and have ridden the 4 roller coaster of ups and downs with my levels 5 getting too high or dropping too low, having a hard 6 time finding a balance. 7 Having a new treatment like this will be so 8 9 helpful because many people are like me and battling this rollercoaster ride of ups and downs. 10 We always try to stay positive, we try to keep on 11 12 with our regular lives, and we try to do the best we can to be normal. But it's hard to do that when 13 14 exhaustion is your constant companion. I ask that you remember this as you consider 15 your decision today. All of our bodies are 16 different, and as more medications become 17 18 available, more people in my situation will find 19 some peace in their life as they can find the right medication for them. Thank you for your time. 20 21 (Pause.) DR. YU: Dr. Lewis, are you there? 22

Speaker number 6, your audio is DR. LEWIS: Will speaker number 6 begin and connected now. Please state your name and any introduce yourself? organization you are representing for the record. DR. PAUL: My name is Dr. Subir Paul. have been a practicing nephrologist in northwest Alabama, in Shoals Kidney and Hypertension Clinic in Florence, Alabama for the last 25 years. I'm a fellow of the American Society of Nephrology. also trained resident physicians, medical students, and do clinical trials. I was one of the principal investigators of the phase 3 trial and have no financial disclosures relevant to the product of roxadustat and today's talk. I am speaking on my own behalf. For last three decades, we have been treating anemia of CKD with various erythropoiesis stimulating agents, or ESA, and IV iron. intestinal iron absorption is poor in our patients, when inflammation develops in many of our CKD patients, hepcidin expression in liver goes up, preventing iron absorption and iron mobilization;

July 15 2021

thus erythropoiesis goes down causing ESA resistance.

I became interested to be a principal investigator for this trial for a number of reasons. Number one, it is a novel oral agent.

Number two, it has a unique mechanism of action.

It inhibits hypoxia inducible factor prolyl hydroxylase, and this stabilizes HIF and increases endogenous erythropoietin production.

Number three, it inhibits hepcidin and increases iron absorption and iron transport to bone marrow for erythropoiesis. Number four, I felt that this approach is physiological and this agent will be effective and safe.

I found that the patients who are treated with roxadustat have a [indiscernible] significant rise of hemoglobin without much need for IV iron. They felt significantly better. Their energy level improved, shortness of breath decreased, and they were highly satisfied. It offers a very similar advantage for patients on peritoneal dialysis and for patients with CKD not on dialysis who live 56

FDA CRDAC July 15 2021 223

to 70 miles away from my office or from the 1 dialysis center. Many are elderly who cannot drive 2 and face problems in getting transportation. 3 Thus, CKD anemia patients not on dialysis 4 while receiving ESA need frequent IV iron therapy 5 with the vein punctures. These repeated injuries 6 to the veins may cause significant issues for good 7 fistula formation and fistula functioning and 8 increase the risk for total [indiscernible] 9 catheter placement for hemodialysis. Total 10 [indiscernible] catheter increases the risk for 11 blood stem infections and mortality. 12 I have seen ESA resistance in many of my 13 14 patients and this probably will be of significant benefit to them. If approved by FDA, roxadustat 15 will be beneficial to treat anemia in patients on 16 maintenance hemodialysis, peritoneal dialysis, and 17 18 CKD patients not on dialysis. It will be 19 especially very useful --20

DR. LEWIS: Thank you, speaker number 6. Your time is up.

21

22

DR. PAUL: Thank you for your attention.

Speaker number 7, your audio is DR. LEWIS: Will speaker number 7 begin and connected now. Please state your name and any introduce yourself? organization you are representing for the record. My name is Dr. Jessica DR. COLEMAN: Hi. Coleman. I'm a private practice nephrologist with Nephrology and Hypertension Medical Associates. have a financial relationship with AstraZeneca through my position as a paid speaking consultant, and that's my only disclosure. With that, I'm going to go ahead and start my three minutes. I want to first thank the committee for this opportunity to share not only my experience, but my patients' experience with anemia of CKD and give some clinical insight into the burden of this disease state. We know that anemia in CKD is prevalent with 5 million adults in the United States suffering from the disease, but less than 25 percent of patients provided care prior to dialysis initiation. I'd like to give you a clinical vignette that highlights why this occurs and possibly why

July 15 2021

225

having an oral agent would really be very 1 beneficial to treat this disease state, and I 2 really believe an oral agent would revolutionize 3 the field. I don't need to go into the common 4 symptoms of anemia. The previous speakers, and 5 especially the patients, have done an eloquent job 6 of sharing how it impacted their personal lives. 7 But as clinicians, we know there are even more dire 8 9 potential outcomes. The subclinical symptoms of fatigue and 10 dizziness can have end-organ damage, hypoxic 11 12 injury, so that there's a really substantial impairment that occurs to the patient and to their 13 disease process. Current guideline-directed 14 therapy can be very difficult to achieve, so I'd 15 like to talk about a very typical patient in my 16 clinical practice, Ms. A. 17 18 She is a 62-year-old African American female 19 who has stage 3B CKD with a GFR of 32 percent, diabetes, hypertension, cardiac disease, and she's 20 21 a caregiver for her elderly mother and uncle, as well as two young great-grandchildren. Her average 22

way.

July 15 2021

226

hemoglobin is 9.8 over the last three years that I have cared for her. She routinely feels tired, run-down, and in order to treat her anemia, we have sent her to hematology so that she can receive IV iron, ESAs, and other supplemental strategies as appropriate. However, she lives over an hour away; therefore, to come every other week to receive her injection, or not if her hemoglobin is too high, she has to arrange care for four other individuals. She has to align transportation at least 3 days prior to her appointment, and has an average of a 5-to-6-hour day just for receiving simple ESA injection, and that's assuming everything goes well with no delays. There's also a financial burden

Ms. A therefore understandably has trouble appreciating her obvious time commitment, logistical difficulties, and financial burden, and whether or not that's actually worthwhile. What she doesn't understand is that by missing

which costs an average of \$40 transportation one

July 15 2021

227

appointments and not participating fully in our own 1 health care, she's actually working against 2 herself, and thereby perpetuating the vicious cycle 3 of anemia in CKD. 4 Currently today in my office, I'm seeing 5 28 patients, 15 of whom have anemia of CKD and have 6 7 similar appearances and challenges to Ms. A. She's --8 9 DR. LEWIS: Thank you, speaker number 7. Speaker number 8, your audio is connected 10 Will speaker number 8 begin and introduce 11 12 yourself? Please state your name and any organization you are representing for the record. 13 DR. WEI: Good afternoon. Dr. Alice Wei 14 speaking. I have been a nephrologist in private 15 practice in Harlem of New York City for over 16 I've no financial disclosures to make, 17 18 and I'm speaking on behalf of myself and patients. 19 Many inner-city groups, including patients like mine in Harlem, have difficulty accessing 20 21 medical care. Either because of frailty, health literacy, or health system inefficiencies, most 22

July 15 2021

patients are unable to obtain the standard treatment for severe anemia of chronic kidney disease. Patients are afraid to inject themselves with ESAs. They find going to a doctor's office every week or month for injections taxing, and some patients who need to be referred to a hematologist or hospital setting for IV iron infusion find this too burdensome.

Anemia of CKD leads to many of the symptoms we associate with frailty as we heard from patient speakers earlier: easy fatigability, weakness, slowness of gait, and diminished cognition. It also increases the risk of CKD progression, cardiovascular morbidity, and mortality.

Since ESA trials have not shown to improve mortality or other hard outcomes, we are desperate for another option to treat anemia of CKD. Because roxadustat is an oral medication, it will be far more accessible to patients in need, and because roxadustat also enhances iron absorption from the gut, we can expect less need for IV iron infusions.

Improvement in anemia means less

July 15 2021

229

transfusions, too, which leads to a better chance 1 of patients having a successful kidney transplant. 2 This will ultimately offer a better patient 3 experience, better outcomes, and less utilization 4 of services such as physician office visits, 5 injectable or infusion medications, and 6 transfusions. 7 With an option like roxadustat, I can be 8 assured my patients can get the treatment they 9 need, so I spend less time coordinating expensive 10 services and more time treating patients, focusing 11 on maintaining their kidney health and keeping 12 patients off dialysis. 13 14 Thank you for your time and your consideration in approving roxadustat as a new 15 treatment option for anemia of chronic kidney 16 disease. 17 18 DR. LEWIS: Thank you, speaker number 8. 19 Speaking number 9, your audio is connected Will speaker number 9 begin and introduce 20 21 yourself? Please state your name and any organization you are representing for the record. 22

DR. MANLLO-KARIM: Good afternoon. My name is Roberto Manllo-Karim. I am a nephrologist in a group practice in south Texas with eight additional partners. We care for roughly 1,300 dialysis patients and over 5,000 patients with CKD. I have been practicing nephrology for almost 30 years. Conflict of interest, I participated as principal investigator in clinical trials for FibroGen. own 1000 shares of FibroGen stock. I didn't receive any underwriting for this presentation. I don't think I have to educate the community regarding the high prevalence of anemia in chronic kidney disease, especially stages 4 and 5. Anemia not only causes multiple symptoms but also has an impact on cardiovascular events, progression of chronic kidney disease, and overall mortality. One thing that practicing physicians like myself know is the level of therapeutic inertia that occurs given the limited choices available to us to treat anemia. Basically, we have three options: iron supplementation, erythropoietin

July 15 2021

231

stimulating agents, and transfusion. 1 We all know about issues of tolerability of 2 oral iron supplementation. There are even higher 3 risks when it comes to intravenous iron 4 supplementation, including hypertension, allergy, 5 and the inability to use in the setting of 6 infections. 7 Erythropoietin stimulating agents carry the 8 9 risk of hypertension, stroke, progression of 10 malignancy, as well as graft thrombosis. Transfusion is out of favor due to possible 11 allosensitization of future transplant recipients. 12 What my patients and I like about the use of 13 roxadustat is that it mimics normal adaptation to 14 altitude. This is basic physiology as opposed to 15 supratherapeutic doses of ESAs and very high doses 16 of intravenous iron supplementation, which no human 17 18 being ever sees in their lifetime under normal conditions. 19 We all know well about the role of 20 21 functional iron deficiency in chronic kidney disease that limits iron availability. Roxadustat 22

allows not only physiological rising EPO levels but also enhances oral iron absorption. We frequently encounter dialysis patients with anemia that have a high ferritin but a low iron separation. afraid to give a patient additional intravenous iron because of the high ferritin, but at the same time they may not respond to erythropoietin because of the low iron separation. HIF inhibitors such as roxadustat will allow additional iron availability and increase EPO levels. Roxadustat will be a great agent of choice for these types of patients. In my experience, roxadustat is well tolerated, safe, and effective, and should become first-line treatment for anemia in patients with chronic kidney disease in the office. It should also be an option for treating anemia in dialysis patients, especially peritoneal dialysis, rivaling [ph] the time-tested erythropoietin. Thank you very much for your attention. DR. LEWIS: Thank you, speaker number 9. Speaker number 10, your audio is connected

My dad's CKD was triggered after a MRSA infection that affected multiple joints. Unexpectedly, he became handicapped and unable to walk or use his right hand. He had to move in with As a result, we built ramps for him to better access our home, but now that limits how we can park in our garage. To get him anywhere, we must maneuver vehicles around for him to get down the ramp, move around the vehicle, and we lift the heavy equipment in and out of the vehicle for appointments. It most reminds me of when I would struggle to get my stroller through the door at the mall that wasn't automatic; one child in the stroller, one holding my hand, and my foot trying to pry the Physically, the in and out of the car door open. for appointments can be incredibly painful and occasionally seems impossible. He's always willing his body to cooperate, and I can only watch as he

early days when we were both learning, he may have 1 accidentally rolled away from me a few times as I 2 was trying to hold the door and wheel him into the 3 building at the same time. We laugh about it. 4 Getting him to his injection appointments 5 isn't just a strain on us physically but 6 logistically as well. As a family of five plus my 7 dad, we have a very busy schedule. This is just 8 9 the smallest glimpse into our struggles of getting him to injections outside of our home. 10 There's no doubt in my mind that having an 11 oral treatment like roxadustat would be 12 life-changing and reduce some of the physical 13 difficulties of in-office treatment. Thank you for 14 your time. 15 Thank you, speaker number 10. DR. LEWIS: 16 Speaker number 11, your audio is connected 17 18 Will speaker number 11 begin and introduce 19 yourself? Please state your name and any organization you are representing for the record. 20 21 MS. GRIFFITH: Hi. My name is Elizabeth Griffith. I am 49 years old. I have no financial 22

FDA CRDAC July 15 2021 236

disclosures.

When I was in grade school, I was told I had anemia due to kidney disease due to a birth defect. Up till 2016, I was able to work, go to school, and do anything I wished without thinking about it, but my life has drastically changed since 2016. I have been unable to work due to now having ESRD and being very anemic.

My nurse has been at a wits end trying over the years to get my hemo levels constant. Previous medication would raise my levels for a day or two, and then it would crash. I was getting the highest dose possible and nothing was helping.

I learned about the trial for this drug from my nurse and doctor. I was so grateful for something that could help me get my energy back and even to do the simple things that most people with normal amounts of energy take for granted, just going to the market, visiting friends, or household chores.

I started the trial in November 2020. Since then, I've gotten my energy back and my life back.

I've been able to schedule daily activities. the small things like making taco sauce, dinner, or even getting the dishes done I've been able to do without taking a break and completing the task That is something that I haven't been able fully. to do since 2016. I'm sharing my story with you because I hope it makes you understand just how much someone struggles with anemia because of kidney disease, the exhaustion that steals the normal things from us year after year. Please consider me as you make your decision for this drug. Thank you so much for the chance to speak. Have a great day. DR. LEWIS: Thank you, speaker number 11. Speaker number 12 is not going to speak. Speaker number 13, your audio is connected Will speaker number 13 begin and introduce yourself? Please state your name and any organization you are representing for the record. MR. CRUMBAUGH: Hello. My name is Louard Crumbaugh, Jr., and I am an 82-year-old retired nuclear engineer now living in Nampa Idaho since

July 15 2021

returning to the U.S. from living and working in Israel for three years. About six years of being back into the country, my doctor explained to me that because of my high blood pressure, my kidneys were failing. Using diet and medications to try to control my high blood pressure was not successful in my case.

My kidney function continued to decline until about two years ago when I was told that I was in complete kidney failure. One of the major problems that I had was anemia. The doctor and I tried to control it with iron supplements with limited success. The next step was to give me iron through infusion.

Getting the infusions worked great but had a few drawbacks. About every 3 to 4 weeks, I had to go to the infusion unit at our local hospital for my injection. First, a sample of my blood was taken and sent to the lab to determine my hemo level, and then after the lab sent the results back to the infusion unit nurse, she would then send an order to the hospital pharmacist to make up the

239

required amount of medication for the infusion. And depending on the workload that the nurses had in the infusion unit, some days I was maybe in the infusion chair for 3 hours or better. This is unusual I think. Taking my blood samples to check for my hemo levels does not sound like anything abnormal, but for me, because of my small veins, most of the nurses had a very difficult time trying to get a sample from me. Many times I'd have large bruise spots on my arms where the nurse had to stick me 3 or 4 times in an area trying to hit a vein with no luck; then after 3 weeks when the bruises were almost healed, it was time for my next iron infusion. During a visit to my dialysis clinic, I was informed about this trial research of a product which would eliminate getting iron infusions. Would I be interested in participating? Oh boy, would I? Here was a product that would help me maintain my hemo levels without these monthly blood draw and iron injections. For me, I feel that the results of taking 1

July 15 2021

240

or 2 pills 3 times a week to give me the same, if 1 not better, results of the iron injections that I 2 took was a real plus. The cost savings alone would 3 be a big selling point. No nurse needed to draw my 4 blood, as well as no lab work needed. The hemo 5 levels could be checked during my regular routine 6 blood work. The hours spent sitting in the 7 infusion chair, now I could utilize it doing 8 9 something at home, reducing the size of my honey-do list. 10 DR. LEWIS: Thank you, speaker number 13. 11 Your time is up. 12 Speaker number 14, your audio is connected 13 14 Will speaker number 14 begin and introduce yourself? Please state your name and any 15 organization you are representing for the record. 16 DR. RASTOGI: Thank you very much. 17 My name 18 is Anjay Rastogi. I'm professor of medicine and 19 clinical chief of nephrology at UCLA Health. not being paid for speaking today, but I've been 20 21 heavily involved with CKD anemia research for the past decade and a half, and I've served as a PI on 22

several HIF stabilizer studies, including those conducted by FibroGen, AstraZeneca, and GSK. also on the Speakers Bureau for AstraZeneca and also act as a consultant for them as well. Anemia of CKD is quite prevalent in the U.S., presenting a significant disease burden with roughly 5 million patients affected, and quite a few of them not being treated for multiple reasons, including access to care and also the fact that most of the drugs that we're using are injectables. Anemia of CKD also has a significant impact on quality of life and is associated with significant morbidity and mortality. All the testimonials that we have had from

All the testimonials that we have had from our patient colleagues, I would completely agree with that; that is my patients say exactly the same things as well.

Prior to recombinant erythropoietin's launch in 1989, a blood transfusion was the main way anemia of CKD was managed. Blood transfusion is something we want to avoid, especially in patients with CKD for the risk of alloimmunization, which

July 15 2021

can complicate the chances of transplantation in the future. Recombinant erythropoietin was very successful in doing this, however, we soon found out that there were significant potential risks associated with recombinant erythropoietin, including mortality, for which it received a boxed warning in 2007.

At the same time these things were happening with recombinant erythropoietin, there were significant advances being made in our understanding of anemia CKD, especially the HIF pathway, and a Nobel Prize was given out in 2019 in medicine or physiology for this.

HIF stabilizers, or hypoxia-inducible factor stabilizers, work more upstream than recombinant erythropoietin and lead to a more coordinated approach to anemia of CKD management, including utilizing endogenous Epogen and more optimal utilization of iron.

Another advantage of HIF stabilizers is that they're oral. This is of special benefit in non-dialysis-dependent CKD patients and home

July 15 2021

243

dialysis. A couple of things to keep in mind that 1 were not discussed so far was passing of the 2 American Advancing Kidney Health Initiative in 3 4 2019, with a major focus on increasing home dialysis and transplantation. 5 We also need to keep the COVID-19 pandemic 6 in perspective. Our hope is that these oral agents 7 will really push more transplantation and more home 8 dialysis and at the same time keeping our patients 9 10 safe at home. I want to again thank you for having me participate. 11 12 DR. LEWIS: Thank you, speaker number 14. Speaker number 15, your audio is connected 13 14 Will speaker number 15 begin and introduce yourself? Please state your name and any 15 organization you are representing for the record. 16 MS. WILLIAMS: Hello, everyone. My name is 17 18 Leigh-Ann Williams. I live in Monroe, Louisiana, 19 which is right outside New Orleans, and I'm the Ambassador for the American Kidney Fund. I thank 20 21 you all for giving me the opportunity to talk about living with kidney disease and anemia. 22

I have a bachelors in toxicology from the University of Louisiana Monroe, a masters of science in clinical toxicology from the University of Florida, and a master of public health from LSU Health Sciences Center in New Orleans, and I currently work in the healthcare field. So I have plenty of education and experience, but none of this has shielded me from anemia. Given that I am used to hemodialysis and needles, the extra stick each month for an additional iron series doesn't bother me. The part of anemia that I find most difficult is the constant lethargy, which is coupled with being tired and worn out from work and dialysis. It is really challenging every day to get up

It is really challenging every day to get up and do daily activities, even simple things around the house. You can manage to do a few little things, but you'll be tired from exerting even just a little bit of energy.

The constant feeling of never getting enough rest truly takes a toll on you. Even if I somehow manage to sleep for 10 uninterrupted hours, I would

July 15 2021

still get up and feel sluggish like I did not get enough rest, and this struggle is just to do a little bit of chores around the house.

It is hard to get up at a good time to go to work because you're always tired and sluggish. I even at one time needed to get several blood transfusions to increase my hemoglobin in my blood. Additionally, day in and day out, you're always cold. You always have to have something extra with you, even a jacket because you'll feel uncomfortably cold in neutral or regular temperatures. You can eventually feel warm enough, but this is just another example of why living with anemia is so difficult and so draining.

For us anemia patients, we need options.

Everything doesn't work for everyone, so we need as many available treatments as possible. There is no one fix for all. Thank you very much for your time today, and I sincerely appreciate the opportunity to share my story about the struggles of living with kidney disease and anemia.

DR. LEWIS: The open public hearing portion

July 15 2021

246

```
of this meeting has now concluded and we will no
1
     longer take comments from the audience.
2
                      Dr. Lewis, hi. I'm so sorry.
3
     is Joyce. We have one more speaker, number 16.
4
             DR. LEWIS: Oh, number 16 did come. Okay,
5
             I apologize.
     great.
6
             Speaker number 16, your audio is connected
7
           Will speaker number 16 begin and introduce
8
     yourself? Please state your name and any
     organization you are representing for the record.
10
             MR. SPIGLER: Good afternoon. My name is
11
     Mike Spigler, and I'm the vice president of patient
12
     services [indiscernible - audio feedback] for the
13
     American Kidney Fund. I do not have a personal
14
     financial relationship with the applicant.
15
             [Inaudible - audio feedback].
16
             So on behalf of the American Kidney Fund,
17
18
     and myself as a primary caregiver to a kidney
19
     disease patient with anemia, I want to thank you
     for the opportunity to address you.
20
21
             Anemia is very common in people with chronic
     kidney disease, also known as CKD. CKD patients
22
```

July 15 2021

247

with anemia often struggle with quality of life 1 [inaudible - audio feedback] -- just like my 2 mom -- [inaudible]. 3 [Inaudible]. However, over the past 5 to 10 4 years we've seen many innovations in rare kidney 5 disease, [inaudible] -- innovative treatments in 6 CKD-related anemia. And while current anemia 7 treatments have been an important part of effective 8 CKD management, there is room for improvement. 9 As COVID-19 [inaudible] -- need greater 10 ability to manage their own care. This is 11 especially true for two groups of patients 12 [inaudible] -- and those who are doing dialysis at 13 14 home. While some patients can be taught to self administer injections at home, it is not for every 15 patient. 16 [Inaudible] -- severe economic hardships, 17 18 and at the American Kidney fund, transportation is 19 the most common request for financial assistance from our safety net program. Providing anemia 20 21 treatment options for patients that will offer less travel to and from a provider for an injection 22

FDA CRDAC July 15 2021 248

would be welcomed by many of the patients.

I want to thank you again for allowing the American Kidney Fund and some of the patients and [inaudible].

Clarifying Questions (continued)

DR. LEWIS: Thank you, speaker 16, and thank you, Joyce.

The open public hearing portion of this meeting has now concluded and we will no longer take comments from the audience. We will now take remaining clarifying questions for all the presenters thus far.

Please use the raised-hand icon to indicate that you have a question and remember to put your hand down after you have asked your question.

Please remember to state your name for the record before you speak and direct your question to a specific presenter, if you can. If you wish for a specific slide to be displayed, please let us know the slide number, if possible.

As a gentle reminder, it would be helpful to acknowledge the end of your question with a thank

July 15 2021

249

```
you and the end of your follow-up question with,
1
      "That is all for my question," so we can move on to
2
      the next panel member.
3
             Dr. Packer?
4
             DR. PACKER: Yes. Thank you so much.
5
             I just want to give the sponsor a chance to
6
7
      address the point that I raised earlier about
     all-cause mortality. It's really the one safety
8
      issue I want to ask about.
9
             Can the sponsor show slide CO-78, please?
10
             Now, I just want to make sure; this is the
11
     only slide I think the sponsor showed on all-cause
12
     mortality in the DD trials. Now, this excludes
13
     trial 613.
14
             I just want to call everyone's attention to
15
      the fact that there are 1940 patients in each
16
      treatment group, and altogether there are about
17
18
      439 deaths. You can see the hazard ratio for
19
      all-cause mortality, which is not statistically
      significant.
20
21
             Can I have the sponsor go to figure 68 in
      their briefing document?
22
```

July 15 2021

250

DR. EISNER: Yes, Dr. Packer. It's Mark 1 We'll work on pulling that up, and 2 Dr. Little will be addressing this question. 3 DR. PACKER: Okay. This comes from the 4 sponsor's briefing document. It's exactly the same 5 set of trials. It's the DD trials, all three 6 7 DD trials, excluding 613. It shows all-cause mortality, again. 8 9 Let me point out the denominators are the 10 same, 1940 in each group. Here we have all-cause mortality and we have 782 deaths. Now, the hazard 11 12 ratio here is 1.17. It goes from 1.02 to 1.35. Now, there are 350 more deaths in this analysis 13 14 than in the slide that the sponsor showed to the committee. 15 Can I go back to slide CO-78? This is the 16 slide you showed the committee. Is it correct to 17 18 say that this isn't an analysis of all-cause 19 mortality; this is an analysis of mortality as the first event in MACE? Is that correct? 20 21 DR. EISNER: I'll ask Dr. Little to address 22 your question.

FDA CRDAC July 15 2021 251

(No response.) 1 DR. EISNER: Dr. Little, you may be on mute. 2 I'm sorry for the delay. 3 DR. LITTLE: is Dustin Little. 4 Dr. Packer, what's reported is all-cause 5 mortality. All deaths are analyzed that occur in 6 the OT-plus-7 days analysis window. 7 DR. PACKER: That can't be true. Go back to 8 your previous slide. Go back to figure 68. 9 are 782 deaths here in the same three trials. 10 Now go back to the slide you just showed me. 11 There are 439 deaths. This is not an analysis of 12 all-cause mortality; this is an analysis of deaths 13 14 that occurred as the first event in your MACE analysis. 15 Isn't that correct? 16 DR. LITTLE: Dr. Packer, what we're seeing 17 18 on the screen is the results for on-treatment-19 plus-7 days analysis set. Then the figure that you're referring to from the briefing document, 20 21 that's the so-called ITT or the on-study analysis. I'd like to just take a minute to address 22

FDA CRDAC July 15 2021

15 2021 252

that, if I may. Could we please go to CO-74?

Let's take another look at the disposition of patients. One of the challenges of the on-study analysis is that there are some patients with missing information.

If we can quickly go to CO-75, the FDA in their presentation, they mentioned that one of the limitations of on-study analysis can be the inclusion of rescue therapy or alternative therapies following discontinuation of the interventional treatment, and that certainly would be expected to be the case with roxadustat.

I showed you on the previous slide that we do have some missing data in our ITT analysis for all-cause mortality. One of the three studies has more complete follow-up with actually 99 percent ascertainment of MACE. That's Study 002, and that study has a hazard ratio point estimate for all-cause mortality of 1.09, which is more consistent with the overall results.

DR. PACKER: I'm sorry. Please forgive me. You're not answering my question.

July 15 2021

253

Can we just go back to your figure 68 in 1 your own briefing? 2 Dr. Packer, it's Mark Eisner 3 DR. EISNER: I think the difference is in the 4 again. ascertainment window. OT-7 is a much shorter 5 ascertainment window than on-study, where patients 6 are followed off treatment to the end of the study; 7 so more deaths are captured because they're 8 followed for longer during that ascertainment 9 window. 10 So I think the discrepancy that you're 11 focusing on is not really a discrepancy. It's just 12 a difference between an OT-7 ascertainment window 13 14 and an on-study ascertainment window, which could have followed patients for much, much longer. 15 Does that help? 16 DR. PACKER: It does help, and I appreciate 17 18 the clarification very much. But can I maybe just 19 ask one more thing? You're showing a similar effect may be a 20 21 slightly greater risk with your agent compared to an ESA, which is labeled for an increase in 22

FDA CRDAC July 15 2021

254

```
mortality.
1
             Now, can you put up the mortality data for
2
      the Study 613?
3
4
             DR. EISNER: We will do. And while we're
     pulling it up, let me just say that the ESA doses
5
     we used in our pivotal trials were lower than those
6
     that were used in other studies such as the normal
7
     hematocrit study or CHOIR. And what you can see on
8
     the bars on the right is our epoetin alfa dosing
9
      level versus those that are used --
10
             DR. PACKER: I understand that, but can you
11
     put up the all-cause mortality for Study 613?
12
             DR. EISNER: Yes, we're working on that. I
13
14
     was just trying to clarify the epoetin alfa risk in
      our trials is actually lower than the --
15
              (Crosstalk.)
16
             DR. PACKER: It may be, but --
17
18
             DR. LEWIS: Dr. Eisner, can we put up the
19
      slide he's requesting, please?
             DR. EISNER: Yes, we're working on that.
20
21
             DR. LEWIS:
                          It's in your deck.
             DR. PACKER: I just want to say that it
22
```

July 15 2021

255

```
could be that the epo dose is lower, but we don't
1
     know that the epo dose that you're using is not
2
      associated with an increased risk of death.
3
             DR. EISNER: That's a fair point.
4
             DR. PACKER: Please, I don't want the
5
     meta-analysis; I want the Kaplan-Meier curves for
6
7
     Study 613, all-cause mortality, please.
             DR. EISNER: We will get that for you.
8
9
             I believe this is what you're looking for.
             DR. PACKER: Yes. Let me just say that the
10
      FDA did an analysis of this. This is a comparison
11
     of roxadustat versus two different ESAs.
12
     not part of the meta-analysis; this is all-cause
13
14
     mortality. I believe the hazard ratio here is
      1.54, with a lower bound that is greater than 1.
15
             Is that correct?
16
             DR. EISNER: Let me ask Dr. Little to
17
18
      address that question and also to speak a little
19
     bit more about the study more generally.
             Dr. Little?
20
21
             DR. LEWIS: Dr. Little, if you could confine
      your comments to answer Dr. Packard's questions
22
```

July 15 2021

256

specifically. 1 DR. LITTLE: Yes. Dustin Little. 2 The hazard ratio point estimate is estimated 3 4 to be 1.67 on our analysis using the study-specific stratification factors with the lower bound of 5 1.12. 6 May I have a moment to show some information 7 on dosing? Just briefly, we talked about how there 8 were some differences between Study 613 and the 9 other trials, and one of the differences was that 10 higher starting doses of roxadustat were used in 11 Study 613. 12 Just on the left, we have a few metrics 13 14 suggesting that starting doses may have been too high, and we note that in the DD pool -- that's the 15 three studies -- dose reduction, dose holds, 16 hemoglobin overshoots, and rapid rates of 17 18 hemoglobin rise were more common for roxadustat 19 versus epoetin alfa, but that was particularly more common in Study 613. This is one of the design 20 21 differences in Study 613, which --DR. PACKER: I really appreciate that. 22

257

FDA CRDAC July 15 2021

Thank you very much. 1 Are you implying that there is a 2 dose-dependent increase in mortality with 3 roxadustat? I think you just said that, right? 4 DR. EISNER: Dr. Little, would you like to 5 address the question? 6 DR. PACKER: You said that you used higher 7 doses and you got a hazard ratio of 1.54. You used 8 lower doses; you got a hazard ratio of -- well, it 9 sort of depends on which one you look at it. 10 Is that what you're telling us? I think 11 that what you just said. 12 DR. LITTLE: Dr. Packer, when we look at our 13 data to investigate for dose-dependence regarding 14 all-cause mortality in MACE, we don't find it to be 15 particularly conclusive. So our mitigation 16 strategy regarding our dosing really is aimed at 17 18 thrombosis. 19 I think some people would consider that the mitigations that have been undertaken with ESA, and 20 21 we're undertaking similar mitigations with roxadustat, have been aimed at reducing 22

July 15 2021

25	Q
23	0

cardiovascular risk. But the most clear evidence 1 that we can provide is that we accept our dosing 2 changes to mitigate risk of thrombosis. 3 We do consider that, overall, when we look 4 at our data versus ESA in the dialysis population, 5 including when we pooled Study 613 with the other 6 studies, that we don't see evidence of increased 7 cardiovascular risk with roxadustat versus ESA. 8 9 DR. LEWIS: Thank you, Dr. Packer, and thank you, Dr. Little. 10 Can we go on to the compliance data? 11 DR. EISNER: Yes, I'd be happy to show you 12 that. 13 14 DR. LEWIS: Also, Dr. Eisner, if you have how often there were dose adjustments made in the 15 roxadustat group, I would like to see that data as 16 well. And we have two more questions, maybe three 17 18 now, so we'll move quickly to direct answers 19 specifically. DR. EISNER: Okay. I'll ask Dr. Szczech to 20 21 address your question about compliance. Dr. Szczech? 22

July 15 2021

259	
40)	

```
DR. SZCZECH: Thank you very much. We used
1
      the protocol-specified definitions of how we would
2
      analyze compliance at greater than 75 percent to
3
     pull this side together. As you can see in the NDD
4
     population, we had 95 to 99 percent compliance
5
     based on each study in the NDD population, and --
6
                          Thank you. It's easily read and
7
             DR. LEWIS:
      answers that part of my question.
8
             Is there any correlation, or did you see any
9
     correlation, between non-compliance and adverse
10
      events, or hemoglobin being out of range or rising
11
12
      too quickly?
             DR. SZCZECH: No, we did not see any
13
14
      evidence of that.
             DR. LEWIS: You didn't see it or you didn't
15
     do the analysis?
16
             DR. SZCZECH: We didn't see it.
17
18
             DR. LEWIS: So you have an analysis to
19
      show --
             DR. SZCZECH: I don't have an analysis --
20
21
             DR. LEWIS: -- that noncompliance didn't
      affect that?
22
```

July 15 2021

260

```
DR. SZCZECH: I don't have an analysis to
1
      show you via slide. We can try to get you that
2
      information.
3
4
             DR. LEWIS:
                          Thank you.
             DR. SZCZECH: But there --
5
             DR. LEWIS: Sorry?
6
             DR. SZCZECH: I'm done.
7
                                       Thank you.
             DR. LEWIS: Ms. Alikhaani, you have a
8
9
      question.
10
              (No response.)
             DR. LEWIS: I think you're muted still.
11
             MS. ALIKHAANI: This is Jacqueline
12
     Alikhaani. I'm very concerned about the safety
13
14
      issues presented by the FDA and I agree with those.
      They seem very reasonable to me, and it seems like
15
      it should be possible to better address and remedy
16
      those safety concerns and risk factors for
17
      roxadustat.
18
19
             I just want to know to the sponsor, I just
     have this question. Are you willing and able to
20
21
     work to address those concerns and come back to us
     with the positive outcomes?
22
```

July 15 2021

261

DR. EISNER: Thanks for the question. 1 has been stated, we've conducted the largest 2 pivotal trial program in CKD anemia, and we have an 3 abundance of data to adequately address the safety 4 and efficacy issues that should enable, we believe, 5 an approval of the product, with appropriate 6 labeling that delineates the safety and efficacy 7 and how the product should be used so clinicians 8 and patients can make those decisions about it. 9 10 As Dr. Little mentioned, we are proposing a postmarketing, real-world data study to test our 11 mitigation strategy of lowering the starting dose 12 and lowering the hemoglobin target. Because 13 roxadustat is a titratable drug and hemoglobin can 14 be measured very readily, we think this strategy 15 will be highly successful, and we are fully 16 committed to further confirming that in a 17 18 postmarketing setting. 19 MS. ALIKHAANI: Thank you. DR. LEWIS: Dr. O'Connor? 20 21 (No response.) Dr. O'Connor, your hand is up. 22 DR. LEWIS:

July 15 2021

```
Are you muted?
1
              (No response.)
2
              DR. LEWIS: Okay. You are muted, for sure
3
     now.
4
              I'm going to go on for time sake, and I'll
5
      come back to Dr. O'Connor.
6
7
             Mr. Conway?
             MR. CONWAY: Thank you very much. We heard
8
     the FDA talk about, on one of their slides, that
9
10
      overcorrection and overshooting was an issue, and
     we've seen the sponsor's slide deck here on
11
      information that shows it met the first 7 days,
12
     where there is a safety concern, in my opinion, as
13
14
      a patient who's gone through all the different
      things that were described in terms of the burden
15
     of anemia.
16
              I'm trying to figure this out because what
17
18
      it seems to me is that you're trying to give us
19
     assurance on the safety based on modeling, and then
     you're looking at a postmarket study involving
20
21
     patients and that type of thing. But in plain
      language, here's my question.
22
```

July 15 2021

263

In plain language, can you tell the patient 1 community that's listening why you should move 2 forward on this if you're relying on a model to 3 show safety and efficacy by reducing dosing and 4 mitigation measures as opposed to waiting and 5 seeing what that actually looks like if you do some 6 other type of study on that? 7 Why should this move forward into a patient 8 population relying on modeling? That I think is a 9 That's my question. Thanks. 10 fair question. DR. EISNER: No. Thanks for the question, 11 and I'll ask Dr. Little to respond to it. 12 DR. LITTLE: Dustin Little here. 13 14 Mr. Conway, there were a few parts to your question. One part had to do with the reliance on 15 I'd like to quickly show you a slide modeling. 16 that does demonstrate from a phase 2 study the 17 18 concept that, indeed, we can see we will have lower 19 rates of hemoglobin rise and fewer overshoots with lower starting doses of roxadustat. 20 21 100 milligrams 3 times a week was the highest starting dose used in the phase 3 studies 22

July 15 2021

for patients who were not on ESA at baseline, and then our recommended starting doses are 50 or 40 milligrams 3 times a week. So in addition to modeling data, we do have clinical data that supports that we will see the expected changes in hemoglobin with lowering the starting dose.

Then the other question that you asked had to do with what we can say to patients. We heard from Dr. Pecoits and from some of the presenters during the open public forum that there is a substantial unmet medical need now for a drug like roxadustat that has an oral mechanism of action that's effective across broad subgroups of patients, including patients for whom ESAs are not particularly effective.

We consider that our data supports a positive risk-benefit ratio currently. We did note some safety imbalances, especially thrombosis and vascular access thrombosis, which we've spoken about quite a bit today. We consider that we can mitigate those risks. We plan to study that. But of course we do consider that those data should be

FDA CRDAC July 15 2021 265

in the label, and there should be warnings about that in the label so that physicians can have the option and make considerations regarding the patients in front of them in their office.

Ouestions to the Committee and Discussion

DR. LEWIS: Thank you very much.

I apologize to my other panel members, but we do have six questions, so I think we have to move on. We did get in the unanswered questions from previously and a few other ones, so I apologize. If you'll please put your hands down, we will proceed with the questions to the committee and panel discussions.

I would like to remind public observers that while this meeting is open for public observation, public attendees may not participate, except at the specific request of the panel. After I read each question, we will pause for any questions or comments concerning its wording, then we will open the question to discussion. We will start with question number 1.

Discuss the benefits and risks of roxadustat

July 15 2021

266

in the non-dialysis-dependent population. 1 Are there any issues or questions about the 2 wording of the question from the panel members? 3 (No response.) 4 DR. LEWIS: I don't see any hands, so if 5 there are no questions or comments concerning the 6 7 wording of the question, we will now open the question to discussion. 8 9 (No response.) DR. LEWIS: The question is open to 10 discussion. I quess I'll start since everyone's 11 12 getting ready to get ready for it. I do think that patients have spoken 13 eloquently of the convenience of not going in to 14 receive an EPO injection, and that's clearly a 15 benefit. That's a convenience benefit. It's also 16 a risk because it means patients could conceivably 17 18 have any physician write them a year's supply of 19 roxadustat and never get another hemoglobin. They do need to go in once or twice a month 20 21 for hemoglobins, and in many places that could be done stat, their injection or subcutaneous 22

July 15 2021

267

injection given, so I think it has a benefit in a 1 risk. 2 Otherwise, I'm very concerned about the 3 safety signals that we see that are certainly not 4 inferior to those with ESA. I think ESA, if we had 5 known all those safety signals, may have been 6 handled differently when it came before the 7 committee. 8 I do think that those are some of the risks 9 10 that are very serious, and they could be magnified when it's not under study conditions, not having 11 pill counts, not having people reminded three times 12 to come get their hemoglobin, and you might see far 13 more risks or adverse events associated with the 14 risks that have already been described. 15 I'll pause there. I think my first number 16 one is Dr. O'Connor. 17 18 DR. O'CONNOR: Thanks, Julia. 19 Obviously, I have concerns about efficacy on what we've seen, obviously, with hemoglobin going 20 21 up; no issue there. But I'm confused by the quality-of-life data, Julia, and just maybe as a 22

July 15 2021

268

nephrologist, you and your team could tell me. 1 We've seen significant quality-of-life 2 improvements with iron therapy, for example, in 3 heart-failure patients. Why is it that in such a 4 large study, you can't detect signals of 5 quality-of-life improvement, even with this 6 significant augmentation in improving anemia? 7 The other thing I would say is the 8 9 mitigation program, my guess, with a lower target, 10 would it result in a slightly higher transfusion rate in the active drug and sort of wash out the 11 12 difference between active therapy in the DD patients? 13 14 DR. LEWIS: I guess that was a question to the nephrologists on the panel to some extent. 15 would say that it is surprising that there isn't a 16 quality-of-life signal, and one must wonder if 17 18 there's something offsetting what you would expect 19 to see. You also made another point, which is 20 21 although reduction in IV iron was suggested as a potential benefit, you're right that the cardiology 22

July 15 2021

```
literature currently has some evidence that it is
1
     actually a benefit to be iron replete, so that's of
2
      interest as well.
3
             Did you want to make any more comments,
4
     Dr. O'Connor?
5
             DR. O'CONNOR: No, that's good.
6
             DR. LEWIS: Do any other nephrologists want
7
      to?
8
9
              (No response.)
             DR. LEWIS: Okay, then we'll go on to
10
      Dr. Bairey Merz, please.
11
12
             DR. BAIREY MERZ: Thank you, Dr. Lewis.
             Noel Bairey Merz. I wanted to mirror
13
14
      Dr. Lewis' summary. I completely agree with her,
     and I would like to also point out and feel
15
      strongly about our citizens' testimonies and how
16
      important it is to them, and yet several pointed
17
18
      out that this would be less costly or even more
19
     cost-effective, and we were not presented with any
      cost data. We're hearing how complicated this care
20
21
      is, and I think we would need to be careful about
     making decisions about cost without any cost data.
22
```

July 15 2021

270

I'll also emphasize, if I may, DR. LEWIS: 1 that it is complex. And I, to some extent, 2 disagree with Dr. Fishbane's comments that the main 3 reason that CKD patients are anemic is the 4 logistics of going in for an injection. It is one 5 more trip in some cases, but they have to go in to 6 get their hemoglobin checked. 7 I think the bigger factor is that the 8 complex algorithms to safely deliver this drug are 9 quite daunting, and I think many consider that to 10 be a barrier and are also concerned about the 11 risk-benefit of raising the hemoglobin in the 12 population. So I don't think it's just a logistics 13 14 issue. Our next question is Dr. Packer, or our next 15 discussion. 16 Dr. Packer? 17 18 DR. PACKER: Yes. In my previous comments, 19 I focused on the DD population with respect to all-cause mortality, but I do want to point out 20 21 figure 9 in the FDA document, which shows the effects on all-cause mortality in the NDD 22

July 15 2021

```
population, which is what we're talking about in
1
      this question.
2
             In all studies, in the OT-plus-7 analysis,
3
4
      they're reporting a hazard ratio of 1.4, a
     confidence interval of 1.08 to 1.82. That's
5
     primarily driven by the 001 study, which was the
6
     biggest of all and had the most deaths. That had a
7
     hazard ratio of 1.68 and a confidence interval of
8
      1.25 to 2.6. These are comparisons with placebo
     with a window of on treatment plus 7 days.
10
             DR. LEWIS:
                          Thank you, Dr. Packer.
11
             Dr. Thadhani?
12
             DR. THADHANI:
                            Thank you, Dr. Lewis.
13
             To add to what you had mentioned, Dr. Lewis,
14
     with regards to the monitoring of individuals in
15
      the outpatient setting, is it fair to say that the
16
      likelihood of overshoot was more common in the
17
18
      outpatient -- or, I'm sorry, in the NDD population
19
      as opposed to the DD population?
             At least from the FDA analysis, that
20
21
      appeared to be the case, which would be consistent
     with your comments about while outpatient at-home
22
```

July 15 2021

```
medications may be a convenience, the likelihood of
1
     monitoring or paying more close attention to
2
     monitoring would be more difficult.
3
             DR. LEWIS: Does somebody from the FDA want
4
     to comment on Dr. Thadhani's comment?
5
             Dr. Song?
6
7
             DR. AYACHE:
                          This is Dr. Ayache.
             DR. LEWIS:
                          Oh. Dr. Ayache?
8
                                 In regard to the
9
             DR. AYACHE: Yes.
      overshoot, we saw it in all of the studies in the
10
     NDD population because that's what's compared to
11
12
               As you understand, the initial correction
     phase, there's overshoot as I show in my slide 16.
13
14
             In the DD population, we saw overshooting
     actually in Study 613 and also in Study 64, which
15
     was conducted in the U.S., where the response to
16
     hemoglobin increase was higher in roxadustat than
17
18
      epoetin alfa. Thank you.
19
             Does that answer your question?
             DR. LEWIS:
                          Thanks.
20
21
             DR. THADHANI: Yes, thanks you. That was
     very helpful.
22
                     Thanks.
```

July 15 2021

```
273
```

```
DR. LEWIS:
                          Thank you.
                                      And I will remind
1
     everyone, including myself, to state my name before
2
      I speak.
3
              Dr. Wang, you have a question?
4
              (No response.)
5
              DR. LEWIS: Dr. Wang, you may still be
6
     muted.
7
             DR. WANG: Thank you.
                                     Tommy Wang.
8
9
              I just wanted to make a comment, and it
     could be a question --
10
              DR. LEWIS: It's a comment.
11
              DR. WANG: Okay. It's a comment.
12
              I just want to call out the fact, as has
13
14
     been noted a number of times, that for the NDD
     population, in particular, the interpretation of
15
      the MACE and mortality data are really influenced
16
     by whether you're looking at the on-study analysis,
17
18
     which was stated to be the primary analysis, or the
19
     OT-plus-7 analysis.
              I guess the comment is that I do believe
20
21
      that differential dropout most certainly does
      contribute to some of the OT-plus-7 findings.
22
                                                       Ι
```

July 15 2021

```
found it fairly persuasive that people who dropped
1
     out of these studies were sicker than the ones who
2
3
      stayed in.
             The issue is whether that's enough to
4
     account for the difference. I guess the thought
5
      experiment is that there was differential dropout,
6
7
     but it was a certain proportion of the patients.
      It wasn't like there are three times as many
8
9
     patients that dropped out. You'd have to have a
10
     pretty large increase in risk in those who dropped
      out compared to those who stay in, I would guess on
11
      the order of 50 to 100 percent increase in the risk
12
      of MACE and all-cause mortality, to fully account
13
      for the difference between the OT-plus-7 and the
14
      on-study.
15
              I guess, again, the comment is I'm not sure,
16
      although there are differences, that we can ascribe
17
18
      that large of a differential. Thank you.
19
             DR. LEWIS:
                          Thank you, Dr. Wang.
             Dr. Soergel?
20
21
             DR. SOERGEL: Thanks, Dr. Lewis.
             David Soergel. I was actually going to make
22
```

July 15 2021

```
a similar comment to Dr. Wang's. I think it's
1
      important to remember that in the
2
     non-dialysis-dependent population, the sponsor
3
      compared to placebo, so we did see this non-random
4
     dropout from the trials and we ended up getting
5
      sicker patients followed through the end of the
6
      study, so therefore, the safety profile might
7
      reflect those differences.
8
             The second thing that I found really
9
10
      interesting is we thought about these two
     populations as being two separate populations, but
11
     when you think of an individual patient
12
      transitioning from late-stage CKD into dialysis, I
13
14
      found the incident dialysis data very compelling,
     where hemoglobin was able to be more adequately
15
     controlled in those patients as the disease
16
17
     progressed.
                   Thank you.
18
             DR. LEWIS: Dr. Cho?
19
             DR. CHO:
                       Hi. My comment is that it's clear
      that roxadustat raises hemoglobin, but I'm not
20
21
      convinced that by decreasing the rise of the
     hemoglobin that we would mitigate the risk of
22
```

July 15 2021

276

thrombosis, or infection, or other side effects. 1 Ι think there are mechanisms related to the HIF 2 inhibition that may be predisposing the increase in 3 thrombosis. So I remain quite concerned about the 4 risk mitigation not being able to lower the 5 thrombosis rate. 6 7 DR. LEWIS: Thank you, Dr. Cho. I believe Dr. Cook. 8 DR. COOK: Yes. This is Tom Cook, and I 9 can't directly address this question but I can 10 address the methodology that I've seen today. 11 Actually, I find it strange that I even have 12 to make this comment, but clinical trials are 13 14 fundamentally about assessing causality, and we almost never -- well, I do, but most people in our 15 community don't ever talk about things in terms of 16 causal language. 17 18 We know that -- I hope we know --19 correlation does not imply causation, which means that if we want to assess causality, we need to 20 21 have some formal basis on which we make those decisions. Randomization plus ITT, we know 22

July 15 2021

guarantees that the associations that we see are either random or they're causal because we have removed confounding.

Now, the analyses that we've seen today, most of them, which are based upon these ascertainment windows are not based on ITT, therefore there's no causal basis for doing those analyses, and in my opinion, those analyses are hopefully confounded, and I will ignore them.

So the only analysis that I pay attention to are those which are based upon the full study period, and I would hope that my fellow panel members will seriously discount any of those based on the ascertainment window, especially the 7-day window.

In fact, I would argue I've looked at this question before, and Dave DeMets and I wrote an article in 2019 in JAMA, which we explicitly addressed some of these concerns. And in the data that I've looked at, it's very easy to have a 50 percent or more difference in apparent risk when one does this kind of arbitrary censoring based

July 15 2021

```
upon time on treatment.
1
             I mean, in fact, it's the tail wagging the
2
      dog because the reason that people don't continue
3
4
      treatment is usually related to their clinical
      status, and if their health is failing and they
5
     become at high risk for mortality, then they're
6
     likely to discontinue treatment. And therefore,
7
      these kinds of analyses are just fundamentally
8
9
     broken, and I will pay no attention to them.
10
      you.
             DR. LEWIS: But the analyses that showed
11
      safety signals that were the ITT analysis, you
12
     would put weight or at least --
13
14
             DR. COOK: I would, yes.
             DR. LEWIS: -- consider.
15
             DR. COOK: Yes, I would.
16
             DR. LEWIS:
                          Thank you, Dr. Cook.
17
18
             I believe Dr. Packer is next.
19
             DR. PACKER:
                           I just wanted to ask Dr. Cook a
                 The concept of intention to treat in any
20
21
      trial is that you start out with some assurance of
     balanced populations at the start of the study
22
```

July 15 2021

279

because of randomization, and then you follow all 1 patients for the planned duration of therapy and 2 count all events, whether people stay on treatment 3 or not. 4 When you do that, that's a true ITT 5 analysis, and what we're seeing today doesn't 6 approximate that standard, either the on-treatment, 7 the on-treatment plus 7 days, or the on-treatment 8 9 plus 28 days. None of those approximate a true ITT 10 analysis. So if you wanted to really adhere to ITT, 11 you would discount everything we've looked at today 12 in the NDD population. Now, the DD population is a 13 little bit different because the retention rates in 14 the two groups are actually similar or even favor 15 epo. 16 Dr. Cook, do you really think that 17 18 on-treatment here represents an intention-to-treat 19 population? I don't think so. No, I agree a hundred percent. 20 DR. COOK: 21 This is Tom Cook. I agree a hundred percent. DR. PACKER: Yes. 22

July 15 2021

280

DR. COOK: What Dave DeMets and I say in our 2019 JAMA paper is if you see a difference or the lack of difference between two arms, it's due to one of three things, either chance, causation, or confounding. And what randomization does, is it eliminates the confounding. So now you look at your confidence intervals and your p-values, and you say this likely could be due to chance. And if you rule out chance, then you know it's causal. If I condition on being on treatment plus some period of time, I actually reintroduce confounding for the very reasons that have been discussed, except they haven't been framed in terms of causal language. In fact, I would argue that even in the DD population --DR. LEWIS: If I may, I think we're straying from the question --DR. COOK: Yes. But the question is how do you evaluate the evidence that's in front of us? Yes. Thank you. DR. LEWIS: We have six questions and 30 minutes, so I think I'm going to move on to the second question,

FDA CRDAC July 15 2021

281

and perhaps some of you, Dr. Wang, can put your 1 comments into the second question. 2 I'm now going to read the second question. 3 If you have concerns regarding these risks, 4 discuss whether you believe they could be addressed 5 through modification of the treatment algorithm, 6 for example, changes in target hemoglobin, starting 7 dose, titration scheme, and monitoring paradigm. 8 If you favor changes to the treatment 9 algorithm to enhance safety, discuss whether they 10 should be tested prior to approval, after approval, 11 12 or not at all. Are there any questions about the wording of 13 14 the question? Dr. Cook, do you have your hand up for a 15 question about the wording of the question 16 number 2? 17 18 DR. COOK: No, I just forgot to put it down. 19 Thank you. DR. LEWIS: 20 Okay. 21 So if there are no questions or comments concerning the wording of the question, we will now 22

July 15 2021

```
open the question to discussion.
1
             Dr. Crowley?
2
3
              (No response.)
             DR. LEWIS: Dr. Crowley, you're on mute.
4
             DR. CROWLEY: Yes.
                                  Thank you.
5
             I think this concept is really a very
6
7
      desirable patient-centered approach to treatment of
      anemia, and I think we can all agree that there's
8
9
      demonstrated efficacy. But it seems like the real
      challenge here is can we control the risks that are
10
      associated with any ESA, including roxadustat in
11
      this particular consideration.
12
             In terms of these modifications of the
13
14
      treatment algorithm, I guess the question is, can
      the prescription of this drug come with sufficient
15
      instructions and confidence that these would be
16
      followed, excluding certain patients who would be
17
18
      at extremely high risk for prothrombotic agents,
19
      for ensuring that providers know what they're doing
     with this medication and have a system in place to
20
21
     monitor? It's not enough just to prescribe it, but
      you have to have a recommended monitoring process.
22
```

July 15 2021

283

Can we have sufficient public education such 1 that people appreciate that it's not that you're 2 just going to get a pill and you don't need 3 monitoring; you're still going to need monitoring. 4 That really is a concern, that people think I can 5 just take the pill and I don't have to get my 6 hemoglobin checked. 7 So I think those are the concerns that I 8 would have with regard to how can we mitigate these 9 I think it's possible, but that's really 10 where I worry most, I think. 11 12 DR. LEWIS: Thank you, Dr. Crowley. Dr. Packer? 13 14 DR. PACKER: Yes. I think what the sponsor is proposing seems like a very reasonable approach 15 that needs to be tested. What we don't know is the 16 degree to which the risks that we see, whether it 17 18 be thrombosis, all-cause mortality, infection, 19 whether these risks are related to the rapid increase in hemoglobin or whether it's due to 20 21 potentiation of hypoxia-inducible factor 1 alfa. That uncertainty is not going to be resolved by a 22

July 15 2021

284

stimulation; that uncertainty needs to be resolved 1 by an actual trial. 2 I agree completely, and I think 3 DR. LEWIS: the trial needs to be prior to approval, and the 4 hypothesis that the dose adjustments and different 5 algorithms will mitigate those safety signals needs 6 to be tested. 7 Further, I would actually think there's 8 enough of a safety signal that there may need to be 9 a formal dedicated cardiovascular study not like 10 what was demanded of the hypoglycemic drugs. 11 also have a concern about their ability to be able 12 to do the postmarketing study because of not being 13 able to find enough patients left on ESA to match. 14 So all those things concern me in answer to 15 those questions. 16 Dr. Parsa? 17 18 DR. PARSA: I was about to lower, but I 19 guess I'll reiterate it because what I was thinking was also said by others. Sorry. This is Afshin 20 21 Parsa. I think that, yes, as mentioned before, the 22

July 15 2021

285

ability to understand the risk here is we simply 1 don't have sufficient data to make anything that's 2 definitive enough. The suggestions that were made 3 in terms of changing the hemoglobin target, 4 starting dose, all sound reasonable, but I think 5 those need to be really assessed prior to approval. 6 I have concerns about trying to do this in a 7 postmarketing setting once it's set free out there 8 9 without being properly controlled. I don't think we're going to get the necessary information 10 without doing the proper trial first. 11 DR. LEWIS: Thank you, Dr. Parsa. 12 Mr. Conway? 13 14 MR. CONWAY: Thank you very much. wanted to say I think Dr. Crowley characterized 15 perfectly, at least from my standpoint as an 16 [inaudible - audio gap] -- leader. 17 18 The frustrating thing here is the patient 19 burden that's been articulated, especially during the public comment, I believe is a hundred percent 20 21 accurate. And I have to tell you, having lived with anemia, trying to get a transplant, trying to 22

July 15 2021

286

keep a full-time job -- at the time I was the 1 deputy secretary for the State of Virginia -- just 2 to make it [indiscernible - audio feedback] --3 Friday, come Monday, my epo started tapering down. 4 It's a tremendous burden, and what we're 5 looking at is a vehicle through which patients 6 could theoretically have less burden, which is 7 [inaudible]. So that's kind of the idea. However, 8 when we get down to the drug itself that we're 9 talking about, I'm very concerned about this idea 10 of taking the data that we have and try and 11 12 extrapolate from that, through a model or through some other kind of tangential effort, in my 13 14 opinion, to show that there is safety. So the frustrating thing in listening to 15 this, for me, is that the patient burden is well 16 documented, in my opinion, but the burden is on the 17 18 sponsor to show why this should move forward before 19 it's tested out as opposed to waiting and doing that postmarket. I think we should get it checked 20 21 out before it goes into patients. I really do. Thank you. 22

July 15 2021

287

I also will make a comment that DR. LEWIS: 1 once we know what the appropriate dosing is and 2 perhaps the other study has done it, another 3 consideration is a REMS program, where only 4 physicians who have gone through a certain amount 5 of education are allowed to prescribe it. You do 6 one month's supply, and if the patient doesn't show 7 up for their hemoglobin, to make sure that the dose 8 is still correct for them. 9 They run out. That's another consideration that the FDA 10 could consider to mitigate some of the concerns 11 12 that have been expressed by the committee. Are there any other comments? 13 14 Mr. Conway, your hand is still up, and I wasn't sure if it was still up or you had another 15 comment. 16 MR. O'CONNOR: No, I don't. Thank you very 17 18 much. I'll take it down. Okay. 19 DR. LEWIS: I'm going to make an attempt to summarize the comments on question 1 and 20 21 question 2, and just for time sake, I decided to put them together. 22

July 15 2021

I think the multiple members of the committee have expressed the benefit of less travel to get injections, especially for patients who live far away, and I also really appreciate the patients who made that clear to us during our open session, so we understand that part of it.

Expressed concerns about the safety of the drug itself, such as the concerns about mortality expressed by Dr. Packer, the concerns about overshoot expressed by Dr. Thadhani, and the concerns about even if you look at comparing the OT-7 to the on-study, that there would have to be a tremendous increased risk to explain the mortality in the people who dropped out. Another benefit I forgot to mention that Dr. Soergel mentioned was the very big benefit of an instant hemoglobin is better in people transitioning from CKD and non-dialysis to dialysis.

There is also obviously a concern about other adverse events that are not related perhaps to the hemoglobin or to the proposed mitigation

July 15 2021

289

strategy because of other effects of HIF inhibitors 1 that could contribute to infections and other 2 3 things. We appreciate Dr. Cook's statistical input 4 on the analysis that are most informative to look 5 at. I think there were several people that were 6 concerned about doing the study after 7 postmarketing, and that maybe prior to approval, 8 finding the right dose and seeing if it mitigates 9 10 some of the adverse events might be important. lastly, I mentioned considering a REMS program. 11 If there is no further discussion -- and 12 I'll pause in case someone wants to raise their 13 hand or feels I missed something in that 14 summary -- we will move on to question 3, which is 15 a voting question, and Dr. Joyce Yu will provide 16 the instructions for the voting. 17 18 DR. YU: Thank you. 19 Hi. This is Joyce Yu. Question 3 is a voting question and voting members will use the 20 21 Adobe Connect platform to submit their votes for this meeting. After the chairperson has read the 22

July 15 2021

voting question into the record and all questions and discussion regarding the wording of the vote question are complete, the chairperson will announce that the voting will begin.

If you are a voting member, you will be moved to a breakout room. A new display will appear where you can submit your vote. There will be no discussion in the breakout room. You should select the radio button that is the round circular button in the window that corresponds to your vote, yes, no, or abstain. You should not leave the "no vote" choice selected.

Please note that you do not need to submit or send your vote. Again, you need only to select the radio button that corresponds to your vote. You will have the opportunity to change your vote until the vote is announced as closed. Once all voting members have selected their vote, I will announce that the vote is closed.

Next, the vote results will be displayed on the screen. I will read the vote results from the screen into the record. Next, the chairperson will

291

FDA CRDAC July 15 2021

```
go down the roster and each voting member will
1
     state their name and their vote into the record.
2
      You can also state the reason why you voted as you
3
     did, if you want to. However, you should also
4
     address any subparts of the voting question, if
5
      any.
6
7
             Are there any questions about the voting
     process before we begin?
8
9
              (No response.)
              DR. LEWIS:
                          Thank you, Dr. Yu.
10
              If there are no questions, I will read the
11
     voting question.
12
              Should roxadustat be approved for the
13
      treatment of anemia due to chronic kidney disease
14
      in adult patients not on dialysis? If not, provide
15
      your rationale, as well as recommendations for
16
     additional data and/or analyses that would support
17
18
      a favorable benefit-risk profile and approval of
19
     roxadustat.
             Are there any questions about the wording of
20
21
      the question?
              (No response.)
22
```

July 15 2021

```
DR. LEWIS: If there are no questions or
1
      comments concerning the wording of the question, we
2
     will now begin the voting on question 3.
3
              (Voting.)
4
             DR. YU: The voting has closed and is now
5
      complete. Once the vote results display, I will
6
      read the results into the record.
7
              (Pause.)
8
9
             DR. YU:
                      Thank you.
             The vote results are now displayed.
10
                                                    I will
      read the vote totals into the record.
11
12
      chairperson will go down the list and each voting
     member will state their name and their vote into
13
      the record. You can also state the reason why you
14
     voted as you did, if you want to. However, you
15
      should also address any subparts of the voting
16
      question, if any.
17
18
             The vote total is 1 yes, 13 noes, and zero
     abstentions. Thank you.
19
             DR. LEWIS:
                          Thank you.
20
21
             We will now go down the list and have
      everyone who voted state their name and vote into
22
```

July 15 2021

```
the record. You may also provide justification for
1
      your vote if you wish to. However, please remember
2
      to address any of the subparts of the question that
3
      correspond to your vote.
4
             We'll start with Dr. O'Connor.
5
             DR. O'CONNOR: Christopher O'Connor.
6
      answered no. I'm concerned about the totality of
7
      information with respect to adverse safety signals,
8
     and I don't believe we understand whether the
9
     mitigation strategy dose will be safe. Thank you.
10
             DR. LEWIS:
                          Thank you.
11
             Dr. Crowley?
12
             DR. CROWLEY: Susan Crowley. I voted yes.
13
      I think that with the significant patient burden of
14
     anemia, the associated risks with any ESA that are
15
      similar in roxadustat, a fair way potentially to do
16
      this is to allow patients and providers to do
17
18
      shared decision making under a REMS program to try
19
      to mitigate some of the risks that may be increased
     with roxadustat.
20
21
             I thought that was a potential opportunity
      to allow for the use of this medication to meet an
22
```

July 15 2021

```
294
```

```
unmet need, to address patient suffering, and to
1
      try to control risks.
2
3
             DR. LEWIS:
                          Thank you.
             Dr. Cook?
4
             DR. COOK: Yes. Thomas Cook. I voted no,
5
      and this was difficult for me. But ultimately I
6
     had to listen to the people who thought that the
7
      safety profile wasn't established, especially for
8
9
      the proposed new dosing strategy that the sponsor
      is discussing. I didn't think that their
10
      observational study that they proposed would
11
     actually answer the questions of interest.
12
13
     you.
14
              DR. LEWIS:
                          Thank you, Dr. Cook.
             Dr. Kasper?
15
                          Dr. Ed Kasper. I voted no.
              DR. KASPER:
                                                          Ι
16
     would like to see the mitigation strategy tested
17
18
     prior to a revote or representation of this
19
     particular drug.
                          Thank you, Dr. Kasper.
20
             DR. LEWIS:
21
              Dr. Packer?
22
              (No response.)
```

FDA CRDAC July 15 2021 295

```
DR. LEWIS: Dr. Packer?
1
             DR. PACKER:
                           Sorry. I was needed.
2
             Milton Packer. I voted no. I share the
3
      reason that Dr. O'Connor, Dr. Cook, Dr. Kasper have
4
     already expressed.
5
             I noticed that the sponsor has done all the
6
7
     clinical trials using a very specific strategy, but
     now would like approval for a strategy which has
8
     been developed only as a simulation. If they
9
     really want people to use the new strategy in
10
     clinical practice, they really do need to test it
11
     and show its efficacy and safety.
12
             DR. LEWIS:
                         Thank you, Dr. Packer.
13
14
             Dr. Wang?
             DR. WANG: Yes. Thomas Wang. I voted no,
15
      again, for the reasons stated by my colleagues.
16
      did find the safety data not clear-cut for the
17
18
      reasons mentioned, but the totality of the safety
19
     data somewhat unsettling. I was concerned that
     more definitive data to address this question would
20
21
     have been difficult to obtain in the postmarketing
22
      setting, so that's the reason for my vote.
```

22

July 15 2021

296 DR. LEWIS: Thank you. 1 Dr. Thadhani? 2 DR. THADHANI: Thank you. Ravi Thadhani. 3 voted no for the reasons stated. I found the 4 analysis, with the biased included, difficult to 5 interpret. 6 The only comment, without being redundant, I 7 would make is in looking at how to move forward, I 8 think we just need to acknowledge that this 9 data set of non-dialysis patients is and will be 10 the largest data set we have with regards to 11 efficacy and safety, and before jumping into yet 12 another clinical trial, to look carefully as to 13 what clearly we would need in the most efficient 14 fashion to get this to the finish line if that's 15 the direction that others and the agency feel is 16 possible. Thank you. 17 18 DR. LEWIS: Thank you, Dr. Thadhani. 19 Dr. Conway? MR. CONWAY: Paul Conway. I voted no, with 20 21 difficulty. As much as I am a champion of patient

care, choice, and innovation, I did not feel as

July 15 2021

```
though the safety information presented was
1
      adequate. And I would like to see the mitigation
2
      strategy tested before we roll out to patients that
3
     are very vulnerable in the middle of COVID-19, but
4
     also patients that depend upon vascular access and
5
      other things to keep life going. I think there's
6
     higher burden to show for safety.
7
                          Thank you very much, Mr. Conway.
             DR. LEWIS:
8
             Dr. Cho?
9
             DR. CHO: Hi. Leslie Cho. I voted no for
10
      the reasons that everyone has stated. I do not
11
      think the rise in hemoglobin is the cause of all
12
      thrombosis and all side effects. It's uncertain to
13
     me whether that really is the cause and whether it
14
     really is HIF inhibition that may be the cause of
15
      the thrombosis. Until we test the lower dose in
16
     patient population, I find it not a viable
17
18
      solution.
19
             DR. LEWIS:
                          Thank you, Dr. Cho.
             Dr. Merz?
20
21
             DR. BAIREY MERZ: Hi. Noel Bairey Merz.
                                                         Ι
                 I thought it was quite a clear safety
22
     voted no.
```

July 15 2021

298

signal and an unclear convenience or access signal. 1 I also thought that FDA approval on modeling 2 mitigation strategies would be stepping out of the 3 bounds of certainly what we traditionally do. 4 Thank you, Dr. Merz. 5 DR. LEWIS: Ms. Alikhaani? 6 7 MS. ALIKHAANI: Yes. Jacqueline Alikhaani I voted no. It was a very tough decision here. 8 9 for me because I really value the patient voice, the consumer voice, and the testimony of the 10 patients was very strong and clear that there's a 11 need to get improved care for them, and improving 12 care means safety first, to me. 13 I have family members living with this 14 dreadful disease and it matters a lot on many 15 levels for me, so it's not an easy decision to say 16 I think we do need major risk mitigation and 17 18 accountability assurances to be in place to create 19 the right pathway for approval for roxadustat. I hope we can do that in the future. And whatever 20 21 is done, I hope that we can also have a team of patients, and caregivers, and family members as 22

July 15 2021

```
part of the leadership team for the trial, and the
1
      research to make sure their voices are there and
2
      they're completely informed about all of the
3
     different issues at stake, especially safety.
4
             DR. LEWIS:
                          Thank you.
5
             I voted no, and I agree with all my
6
     colleagues' previous comments.
7
             Dr. Moliterno?
8
9
             DR. MOLITERNO: Oh, you're good, Dr. Lewis.
                  David Moliterno. I voted no.
             Hi.
10
      rewrote the question, which I won't, I think I may
11
     have answered it differently. I do think the drug
12
     has merit, but the question posed was the data
13
14
     given to us as presented by the applicant.
             I think, in short, I agree with
15
     Dr. Thadhani. I think there's a rich data set here
16
      that needs to be dwelled on further and dug into.
17
18
     You remember my comment at the very beginning to
19
      the agency, and Dr. Unger's response that they just
      received this risk mitigation strategy and those
20
21
      related data recently. So I think it will take
     more digging, and more time, and more thinking.
22
```

July 15 2021

300

Maybe this group will have the opportunity to 1 reconsider this compound at a future time. 2 DR. LEWIS: 3 Thank you. Dr. Parsa? 4 This is Afshin Parsa, and I 5 DR. PARSA: voted no. Having treated many patients, I 6 certainly empathize with the logistic challenges 7 and the patient burden. I really wanted this to be 8 available as a choice for treatment, but I'm simply 9 too concerned about the safety signal and think 10 that we still need to work out more of these 11 12 details before this can go forward. DR. LEWIS: Thank you very much. 13 14 I'm going to summarize quickly. I think that the consensus is that the safety signal is 15 concerning to the panel members, concerning enough 16 that they feel that a mitigation study needs to be 17 18 done prior to approval. I think that many people, 19 including Dr. Crowley who voted yes, but many other people -- and I really appreciate our consumer and 20 21 patient reps here -- are very empathetic to the patient's voice of wanting an oral or an easier 22

FDA CRDAC July 15 2021 301

1 therapy, but not at the expense of unknown or perhaps negative safety profile. 2 I think it's also important to note that 3 4 there is concern about effects that will not in any way be related to the hemoglobin rise or to the 5 mitigation study that's being proposed to be done 6 at the recommendation of this committee prior to 7 approval. 8 I think the points were well made that there 9 should be a very careful consideration for what 10 will most efficiently and effectively answer this 11 question in a study, and I applaud us being 12 reminded that we should include patients' and 13 families' voices in feedback on that design as 14 well. 15 We will take a short five-minute break now. 16 Panel members, please remember that there should be 17 18 no chatting or discussion of the meeting topic with 19 anyone during the break . We will resume at 4:35 Eastern Standard Time. 20 21 (Whereupon, at 4:30 p.m., a recess was taken.) 22

July 15 2021

```
DR. LEWIS:
                          Okay. We will now go on to
1
      question 4.
2
              Discuss the benefits and risks of roxadustat
3
      in the dialysis-dependent population.
4
             Are there any issues or questions about the
5
     wording of this question?
6
7
              (No response.)
              DR. LEWIS: If there are no questions or
8
      comments concerning the wording of the question, we
9
     will now open the question to discussion.
10
             Will the panel members please raise their
11
     hand to participate in the discussion.
12
              Dr. Packer?
13
14
              (No response.)
              DR. LEWIS: Dr. Packer, you're still muted.
15
              DR. PACKER: Julia, I really apologize.
16
     keep forgetting to unmute myself.
17
18
             Here I think the data are a little bit
19
      easier to interpret because the differential
      dropout issue is less marked. In fact, the
20
21
      retention rate was actually greater in the epo
      group than the roxadustat group.
22
```

July 15 2021

```
So we don't have a lot of the complications
1
     of the data that we had in the NDD population, and
2
3
     here we have a comparison with a drug which is
     already labeled for increase in mortality and
4
     increase in risks and we're seeing estimates here
5
     that are either similar to or greater than those
6
7
     seen with epo.
             I quess I'm really concerned about
8
9
     Study 613. 613, as the a sponsor said, had a
     little bit higher dose of roxadustat and maybe a
10
     little bit lower dose of epo, and the mortality
11
     differences became even more marked. So there's
12
     something that this drug is doing that is maybe
13
14
      different than epo. And we already know about
     epo's risks, and they're in the label, so this is a
15
     source of concern.
16
             DR. LEWIS:
                         Thank you, Dr. Packer.
17
18
             Dr. Crowley
19
             DR. CROWLEY: Yes. Thanks.
             As Dr. Packer was saying, I think we can
20
21
     have a little greater confidence in the study
      results because we don't have that attrition bias,
22
```

July 15 2021

304

and I think we see, at least for the primary 1 analysis for MACE, fairly neutral results. 2 I think in addition to that, we can have 3 great confidence in terms of the control, the risk 4 mitigation, because patients are coming three times 5 a week for those that are doing in center, or if 6 they're at home, we know they're on home dialysis, 7 they're connected with a clinician, so their 8 follow-up, I think we can have more confidence that 9 patients will understand what this medication is 10 about and that they require monitoring, and we have 11 12 an opportunity for doing that monitoring. For here, I feel a lot more confident with 13 14 this for the dialysis population, although I see the greatest opportunity for the non-dialysis CKD 15 population. 16 17 DR. LEWIS: Thank you. 18 Dr. Wang? 19 DR. WANG: Yes. Tommy Wang. I just wanted to call out the helpful 20 21 comments of Dr. Cook in the last session about the potential strong effects of differential dropout, 22

FDA CRDAC July 15 2021

305

which we talked at length about for the NDD 1 population. Based on his comments, I would say 2 here, as previously pointed out, the attrition 3 rates were much less different and we have an 4 on-study analysis in the DD population shown in 5 figure 12 of the FDA analysis, which show some 6 confidence intervals for MACE and all-cause 7 mortality that exclude one in the unfavorable 8 direction for roxadustat. 9 That finding makes me concerned. And on top 10 of that, as Dr. Packer has noted, the comparison 11 group here is already a drug for which there have 12 been safety signals and a warning attached to it. 13 14 So again, I think in its totality these safety data are not satisfying. Thanks. 15 Thank you, Dr. Wang. DR. LEWIS: 16 Dr. O'Connor? 17 18 DR. O'CONNOR: Chris O'Connor. I just would 19 add to what was said previously, that really applies to the DD populations, that the extremely 20

important RBC transfusion rate advantage is less in

this population. With the mitigation strategy

21

July 15 2021

```
dose, it's unclear, if you look at CO-46, whether
1
      that would even hold up with the lower dose.
2
      think one of the added benefits of this therapy may
3
     be attenuated.
4
             DR. LEWIS:
5
                          Thank you.
             Dr. Parsa?
6
             DR. PARSA: Afshin Parsa. Yes. Here I'm
7
     also seeing that the risk profile is easier to
8
9
     assess, as others have said, and maybe not as
     worrisome. But then the question becomes, what is
10
      the benefit?
11
             We still have an increase, obviously, and
12
      some trend towards death in Study 613.
13
14
     Kaplan-Meier increases over time, suggesting that
     maybe it's not just rate of change of hemoglobin,
15
     but not enough data to really conclude anything
16
     based on that. But there's still increased
17
18
      thrombosis, access clotting, which we all know as a
19
     nephrologist is a nightmare to deal with, as well
      as the patients, it's worse for them.
20
21
             That's still a question, what's the benefit
     here when we're still seeing a signal for risk?
22
```

FDA CRDAC July 15 2021

307

The convenience of the PO and decreasing the 1 patient burden, which is high, is really not 2 modified that much in this circumstance. 3 However, one subgroup that I was thinking in 4 which it might be different here are 9 or 5 10 percent of the dialysis population that are 6 7 resistant to epo treatment, so really high ferritin, or they're just not responding, or you 8 9 can't get them well. 10 In that smaller subgroup, there might be some potential benefit here based on these signals 11 that could mitigate some of those [indiscernible], 12 thrombosis, or other risks that we've seen, but 13 14 certainly not as a whole. But I do want to make the distinction between that subgroup and the rest of 15 the population. 16 DR. LEWIS: Dr. Thadhani? 17 18 DR. THADHANI: Thank you, Dr. Lewis. Thadhani. 19 Just to clarify the transfusion issue, I 20 21 think the comment was made, and that is correct, that the benefit of this treatment is treatment of 22

July 15 2021

```
anemia and obviously reduction of transfusion.
1
      think an aggregate may not have been seen, but I
2
     believe -- and again I apologize that I may not
3
     have all the details -- in Study 064, there was a
4
      reduction in transfusion, which is the US-only
5
      study, I believe, obviously paying close attention
6
     to that, including over 40 percent of
7
     African Americans in that particular study.
8
             I understand the design was such that rescue
9
      therapies involved ESA and then transfusion for the
10
      roxa arm. But that said, there was, I believe, a
11
      reduction in transfusion in 064 but was not seen in
12
      063 and 002. Thank you.
13
14
             DR. LEWIS: Dr. Packer, I believe your hand
      is up again. I don't mean it negatively.
15
      actually asking you is it up again?
16
             DR. PACKER: No, it's not. I'm sorry.
17
18
             DR. LEWIS: Dr. Crowley, your hand is up.
19
     Okay.
             Dr. Cook?
20
21
             DR. COOK: Yes. I just want to comment that
      it's not my concern about the differential in
22
```

July 15 2021

```
1
      dropout, it's the rate of dropout. It still breaks
      ITT if the rates are the same but the rationale
2
     underneath is different, the reasons for dropout.
3
4
     So I'm not convinced just because they're the same
     that that actually improves my understanding of the
5
      overall result.
6
7
             DR. LEWIS: Thank you, Dr. Cook.
             Dr. Soergel?
8
9
             DR. SOERGEL: Thanks, Dr. Lewis.
10
             My view is that based on the FDA-agreed
      analysis, which is beyond therapy plus 7 days, the
11
      data look reassuring for MACE and for all-cause
12
     mortality. There's clear efficacy in this
13
14
     population, and there's been little innovation in
      this space in many years. So I think there's a
15
     place for this medicine, as was commented earlier;
16
      so that's my view.
                          Thank you.
17
18
             DR. LEWIS: Dr. Cook your hand is up.
                                                      Do
19
     you have another comment?
                              Sorry. I forgot to put it
20
             DR. COOK:
                        No.
21
      down.
             DR. LEWIS: I wonder if our patient
22
```

July 15 2021

```
representative or our consumer representative have
1
      a comment.
2
3
              (No response.)
             DR. LEWIS: While they're thinking,
4
     Dr. Packer?
5
             DR. PACKER: Julia, could I ask a guestion?
6
7
      There appears to be a group of patients who are
      resistant to erythropoietin, and these were
8
     patients with a lot of inflammation. It's a
9
10
                I'm not certain how big the subgroup is,
      subgroup.
     but these are patients for which epo is not a
11
     particularly viable option because they don't
12
      respond to it, and they do respond to this drug.
13
             I'm just wondering whether there is a
14
      subgroup of the dialysis-dependent patients that
15
     would actually have an option here that they don't
16
     have with epo because of epo resistance.
17
18
             DR. LEWIS:
                          Thank you, Dr. Packer.
19
             Mr. Conway?
             MR. CONWAY:
                          Thank you. I'm actually
20
21
     wondering the same thing, and based on the data
      that was presented, it could be an effective tool
22
```

July 15 2021

```
for part of that population.
1
             Incredibly, for me, as an advocate, I
2
     believe it should be tested out before it's
3
4
      deployed. I'm not satisfied with the safety
      information. It's close, but I'm just not
5
      comfortable of it holding up as a package in terms
6
     of what we're looking at. Thank you.
7
             DR. LEWIS:
                          Thank you.
8
             Ms. Alikhaani? I should ask you for
9
     permission to call you Ms. Jacqueline so I don't
10
      destroy your name every time. I apologize.
11
      really bad at names, but you have your hand up.
12
              (No response.)
13
             DR. LEWIS: Ms. Alikhaani?
14
              (No response.)
15
             DR. LEWIS: You may be offline. Actually, I
16
     don't see her phone. While we're waiting to get
17
18
     her back online, I'll make a quick comment.
19
             I also was impressed with the data that
      showed that the roxadustat group could raise their
20
21
     hemoglobins in the epo-resistant kind of inflamed
      group, but what's surprising is that it doesn't
22
```

July 15 2021

```
translate, or it doesn't obviously translate, or
1
     wasn't physically translatable, into any harder
2
                 In fact, there were more infections and
3
     more thrombosis.
4
             I asked specifically if they had seen any
5
     positive things besides a higher hemoglobin --
6
     which is of value, don't get me wrong -- and I
7
     guess they did not or they did not do the analysis.
8
             I think we're back online.
9
             Ms. Alikhaani?
10
             MS. ALIKHAANI: Yes?
11
             DR. LEWIS: Your question or comment?
12
             MS. ALIKHAANI: I think I got kicked out
13
14
      again.
             Can you hear me?
             DR. LEWIS: Yes.
                                Sorry we got you kicked
15
     out; glad we got you back.
16
             MS. ALIKHAANI: Okay.
                                     Thank you.
17
18
             I'm a big champion of diversity in clinical
19
     trials because every patient is an individual and I
      think that matters a lot, and the more diversity
20
21
     you have, the better. I was a little bit dismayed
      that we had such a small amount of African
22
```

July 15 2021

Americans in the trial who documented as having the greatest disparities in care for heart disease and other related conditions.

So I really think education and awareness is very important, in general, for these conditions -- not this medication -- and the more we engage with the community, and the patients, the caregivers, the family members, and everybody involved in the trial, and the research from start to finish, I think we're going to have better outcomes all around.

I think it's really critical, and that way we can make sure the trials are designed with the patients right up front with everybody else, and also not just on the table but also at the leadership table for the trials. Hopefully that way we can get these kinds of treatments voted in because I really wanted to vote for this; I really did. I was very hopeful. So hopefully we can get something done in the future.

DR. LEWIS: I particularly appreciate that comment. I actually wrote it down as an intended

July 15 2021

```
comment myself, but for time sake hadn't mentioned
1
      it.
2
              For the non-nephrologists, African Americans
3
     make up about 12 to 15 percent of our population,
4
     but 33 percent of our dialysis population.
5
      tends to also track with social determinants of
6
     health, which are known to affect medication
7
      adherence. I think the underrepresentation,
8
     particularly in the trials overall, of only
9
10
      8 percent, blacks are of concern and unfortunate,
      and hopefully something that could be addressed in
11
      the efficient design of a new trial.
12
              Thank you for bringing that up.
13
14
             MS. ALIKHAANI: Thank you.
             DR. LEWIS: Are there any other comments?
15
              (No response.)
16
              DR. LEWIS: Okay.
                                 If there are no other
17
18
      comments, I will try to summarize our comments to
19
     this question.
              I think that, in general, the committee felt
20
21
      that because there wasn't an uneven follow-up as
     much in this trial, in fact, if anything, a little
22
```

FDA CRDAC July 15 2021

bit more ESA retention but still not a big differential, that the data was easier to interpret. However, the on-study data and the 613 study were of particular concern since many of the MACE things excluded one unfavorable direction for roxadustat, so that remains a concern.

Then there was an issue of what potential benefit is if there were not as big a reduction in transfusions. It was also confounded by the ability to receive ESA. Then, of course, for the patients that are on hemodialysis and going to a center, the benefits of less travel, et cetera, would be missing. The potential safety signal of access clotting was particularly noted to be lifelines for our patients now who are fortunately living long enough on dialysis compared to decades ago, that they do run out of the access.

One group of interest to several panel members were those who are resistant to epo and the potential for this drug to particularly help those patients have a higher hemoglobin.

Let me just glance down the way. Also, I

July 15 2021

316

think the point was made for the first time that 1 it's very important, like we just finished talking 2 about, the underrepresentation of African Americans 3 in the global trials as a whole. Study 064 did 4 have a good representation but had increased 5 deaths, so it still remains a concern. 6 If there's no further discussion on this 7 topic, I will now read question number 5. 8 If you have concerns regarding these risks, 9 discuss whether you believe they could be addressed 10 through modification of the treatment algorithm, 11 for example, changes in target hemoglobin, starting 12 dose, titration scheme, and monitoring paradigm. 13 If you favor changes to the treatment 14 algorithm to enhance safety, discuss whether they 15 should be tested, 1) prior to approval, 2) after 16 approval, or 3) not at all. 17 18 Are there any issues or questions about the 19 wording of the question? (No response.) 20 21 DR. LEWIS: I don't see any hands raised. So if there are no questions or comments concerning 22

July 15 2021

the wording of the question, we will now open the question to discussion. Panel members, please raise your hand and identify yourself.

Dr. Parsa?

DR. PARSA: Afshin Parsa. Just following up on what I've said in response to question 4, which leads into this, it is not so much in terms of the treatment algorithm being different than what was proposed as an update from the applicant, but so much the risk-benefit ratio and then the subgroup of those who are epo resistant.

I do think that since the risk is modest overall, there's still concern. People with epo resistance certainly can be an issue, and I don't mean someone who's epo resistant for a few weeks because of a minor infection, but those that are really more chronically hyporesponsive, requiring high iron and still not being able to get a stable hemoglobin level there.

There is the potential that that group could fall in the category of -- if one defines it properly and has reasonable thresholds, or there is

July 15 2021

318

[indiscernible] and forgets it, to then have some 1 postmarketing follow-up to see how they do while 2 the rest is working there. But even though it's a 3 smaller number of dialysis patients, it's still not 4 an insignificant number, and it could change the 5 risk-benefit ratio, potentially. 6 Thank you, Dr. Parsa. 7 DR. LEWIS: Do other committee members have comments on 8 9 this question? 10 (No response.) DR. LEWIS: You could be able to comment 11 12 again on whether you think the treatment algorithm to enhance safety should be done prior to approval, 13 14 after approval, or not at all because you might have a differential feeling about it than you would 15 for the non-dialysis population. 16 Dr. Packer? 17 18 DR. PACKER: Yes. Julia, I think you're 19 asking us to express our views so that it makes it easy for you to summarize the sense of the 20 21 committee. I think the principle is that we described 22

July 15 2021

319

earlier, that the proposed changes in dosing are 1 based on simulations, and we don't know, in the 2 absence of clinical trial evidence, whether those 3 proposed dosing changes will mitigate the risks. 4 Then there's the other issue that it is 5 possible that the proposed dosing changes will not 6 match the efficacy of epo. We already have a 7 situation where in our randomized trials, the 8 retention rate is higher in the epo group than the 9 roxadustat group, and if we lowered the dose of 10 roxadustat, will that retention difference become 11 12 even greater. So essentially, the proposed dosing regimen 13 should be tested in a clinical trial as opposed to 14 being relying on the simulation. 15 Thank you, Dr. Packer. DR. LEWIS: 16 Dr. Crowley, do you want to comment on 17 18 whether you favor any postmarketing study, 19 premarketing study, for the dialysis-dependent population? 20 I guess the sponsor had 21 DR. CROWLEY: Yes. eluded to, or stated actually, that they were 22

July 15 2021

```
planning to reduce the dose. And perhaps an
1
      assumption I'm making is that they would be in fact
2
     potentially trying to capture that data to inform
3
     us about specifically the question that was just
4
      raised, about whether efficacy is maintained and
5
      risk is reduced.
6
             DR. LEWIS:
7
                          Okay.
             DR. CROWLEY: So I don't know if we can make
8
9
     it a contingency.
             DR. LEWIS: Okay. Thank you, Dr. Crowley.
10
             Mr. Conway?
11
             MR. CONWAY:
                          Sure. Thank you very much.
12
             I think there could be efficacy. Again, I
13
14
      kind of go back to the idea that the mitigation
     measures in modeling do not substitute for testing
15
     prior to approval. Having said that, I really do
16
     understand the patient burden and the patient need
17
18
     here -- it's palpable -- but I think that we need
19
     to see that, especially in regard to issues related
      to VAT and considering that this population, in
20
21
     particular, is highly vulnerable.
             I'd also like to echo the larger point that
22

21

22

July 15 2021

321

has been made about diversity in the trials. actually why at the front end of the conversation today, I brought up the issue about the African American population because I wanted to know from some of the nephrologists whether or not, based on the safety data they were looking at, this is something they would engage African American patients on in a clinical setting since they are such a huge part of the dialysis patient population and our membership, the American Association of Kidney Patients. I just don't think that it lines up with confidence on the safety side before you put this out in a postmarket study situation. Thank you. DR. LEWIS: Thank you, Mr. Conway. Dr. Thadhani? DR. THADHANI: Thank you, Dr. Lewis. Ravi Thadhani. Certainly the comments that have been made are absolutely critical. If we look at the primary analysis, I think, as was stated before for MACE on the OT-plus-7, the neutral effects, the main issue we're dealing with here is

July 15 2021

322

the thromboembolic events. 1 I do believe there is a strong association, 2 with the emphasis on association, between starting 3 4 hemoglobin and rate of rise with that particular complication, which in a monitored setting would 5 be, I would say, easier to manage unlike in the 6 previous discussion. Thank you. 7 Thank you. DR. LEWIS: 8 Dr. Merz? 9 DR. BAIREY MERZ: Thank you. 10 Noel Bairey Merz. I have to agree with 11 12 Ms. Alikhaani that the very low rate of testing in African Americans makes me concerned about safety 13 signals that could be different. I have a lot of 14 experience about clinical trials that did not 15 enroll enough women, and it is only 10-15 years 16 after FDA approval we find out that it's not safe 17 18 in women. There are important facts as well as 19 genetic differences. It's not a stand-alone, but it is a comment, and I wanted to support her 20 21 concern. DR. LEWIS: 22 Thank you.

July 15 2021

If there is no further discussion on this discussion question, we will now move on to question 6, which is a voting question, but I will summarize our discussion before we do that.

In principle, I think that, again, the committee is still hearing the voice of patients wanting an alternative, but remains concerned about the safety signal and the ability of just reducing the dose to resolve the issue of that safety signal, whether it may even be related to it or whether it would be feasible to actually conduct it in a postmarketing setting where the efficacy could be less and the retention in the roxadustat group could be even less, and make it more difficult to assess that in the way they proposed to do the postmarketing evaluation.

I think people do feel more comfortable that for the in-center patients, the mitigation modeling could be implemented more easily. But again, this is a very vulnerable population and, again, it was emphasized that it also has a insufficient data base in what is a very important population in the

July 15 2021

U.S., African American patients.

So I am now going to a voting question, question 6, and I'm going to turn it to Dr. Yu.

DR. YU: Hi, everyone. This is just a reminder, again, before we vote, question 6 is a voting question. Voting members will use the Adobe Connect platform to submit their votes for this meeting. After the chairperson has read the voting question into the record and all questions and discussion regarding the wording of the vote question is complete, the chairperson will announce that the voting will begin.

If you're a voting number, you'll be moved to a breakout room. A new display will appear where you can submit your vote. There will be no discussion in the breakout room. You should select the radio button that is the round circular button in the window that corresponds to your vote, yes, no, or abstain. You should not leave the "no vote" choice selected.

Please note that you do not need to submit or send your vote. Again, you need only to select

July 15 2021

325

the radio button that corresponds to your vote. 1 You will have the opportunity to change your vote 2 until the vote is announced as closed. Once all 3 voting members have selected their vote, I will 4 announce that the vote is closed. 5 Next, the vote results will be displayed on 6 I will read the vote results from the 7 the screen. screen into the record. Next, the chairperson will 8 go down the roster and each voting member will 9 state their name and their vote into the record. 10 You can also state the reason why you voted as you 11 did, if you want. However, you should also address 12 any subparts of the voting question. 13 14 Are there any questions about the voting process before we begin? 15 DR. PACKER: I have just a question. 16 nature of this question is for the general 17 18 treatment of adult patients on dialysis; is that 19 fair? DR. LEWIS: That is how I would interpret 20 21 the question. It's not for a subgroup. 22 Does anyone from the FDA want to confirm

July 15 2021

326

that interpretation? 1 DR. UNGER: This is Dr. Unger. Yes, it's 2 for a general population. We're not talking about 3 any subgroups. 4 Does that answer your question, Dr. Packer? 5 DR. PACKER: Yes, it does. Thank you. 6 7 DR. LEWIS: I'm going to read the question. Should roxadustat be approved for the 8 treatment of anemia due to CKD in adult patients on 9 dialysis? If not, provide your rationale, as well 10 as recommendations, for additional data and/or 11 analysis that would support a favorable 12 benefit-risk profile and approval of roxadustat. 13 14 Are there any further questions or issues about the wording of the question? 15 Dr. Parsa, your hand is up. 16 I was asking the same question 17 DR. PARSA: 18 that was just asked in terms of how does one put in 19 the contingency or subgroup for the reasons that I had raised before, in terms of does one have to 20 21 vote for the population as a whole or do we just keep that as a remark afterwards if we have a 22

July 15 2021

```
1
      contingency for the subgroup, for example, the
     hyporesponsive?
2
                          I think it's the latter, that
3
             DR. LEWIS:
4
      you would leave it as a comment when you explain
     your vote. Dr. Unger has made it clear that it's
5
      the population as a whole.
6
             If there are no further questions or
7
     comments concerning the wording of the question, we
8
     will now begin the voting on question 6.
9
                      Okay. We'll now move voting
10
             DR. YU:
      numbers into the voting breakout room to vote only.
11
      There will be no discussion in the voting breakout
12
      room.
13
14
              (Voting.)
             DR. YU: The voting has closed and is now
15
     complete. Once the vote results display, I will
16
      read the vote result into the record.
17
18
              (Pause.)
19
             DR. YU: The vote results are now displayed.
      I will read the vote totals into the record.
20
21
      chairperson will go down the list and each voting
     member will state their name and their vote into
22
```

July 15 2021

328

the record. You can also state the reason why you 1 voted as you did, if you want to. However, you 2 3 should also address any subparts of the voting question. 4 The vote total is 2 yeses, 12 noes, and zero 5 abstentions. Thank you. 6 7 DR. LEWIS: Thank you, Dr. Yu. We will now go down the list and have 8 everyone who voted state their name and vote into 9 the record. You may also provide justification for 10 your vote, if you wish to. However, please 11 12 remember to address any of the subparts of the question that corresponds to your vote. 13 We'll start with Dr. O'Connor. 14 DR. O'CONNOR: Christopher O'Connor. 15 Му vote was no. First, I want to thank the patient, 16 sponsor, and the FDA who participated in this 17 18 development program in really bringing a robust 19 program to the committee, which allowed us to do our job to protect public safety in a more robust 20 21 fashion with the large number of patients and events. 22

July 15 2021

329

As with the NDD, I'm concerned about the 1 adverse safety signal in the DD population, 2 particularly OS mortality given the high baseline 3 mortality and the absolute mortality risk. I don't 4 believe the modeling and mitigation strategy can 5 replace a prospective randomized trial, but I agree 6 with Dr. Packer, Dr. Lewis, and others that 7 exploring the current database to look at epo 8 resistance group as a possible narrow indication 9 10 link to a post-approval, randomized trial as the lower dose could be a path forward. Thank you. 11 12 DR. LEWIS: Thank you, Dr. O'Connor. Dr. Crowley? 13 14 DR. CROWLEY: Susan Crowley. I voted yes. I voted that based on, again, lack of the attrition 15 The primary analysis suggested neutrality 16 for both MACE as well as all-cause mortality. 17 18 Because there is an unmet need for our home 19 dialysis patients, as well as our epo-resistant patients, and I think that we have more control in 20 21 a dialysis setting for regulating dosing, et cetera. 22

doing this.

```
FDA CRDAC
                             July 15 2021
                                                          330
              DR. LEWIS:
                          Thank you, Dr. Crowley.
1
              Dr. Cook?
2
              DR. COOK:
                        Thomas Cook. I voted no,
3
4
     principally because I think we need more
      information on both the efficacy and safety of the
5
      dosing strategy.
6
              DR. LEWIS:
7
                          Thank you.
              Dr. Kasper?
8
                          Dr. Ed Kasper. Dr. Lewis,
9
              DR. KASPER:
10
      thank you very much; interesting day.
              I voted no, and Dr. O'Connor I think nicely
11
      summarized my reasonings as well. I would say that
12
13
      if the FDA wish to go forward with approval for
      roxadustat in ESA-resistant patients, that I would
14
      support that. Thank you.
15
                          Thank you, Dr. Kasper.
              DR. LEWIS:
16
              Dr. Packer?
17
18
              (No response.)
19
              DR. LEWIS: Dr. Packer, you're probably
      still muted.
20
21
              DR. PACKER: Julia, I'm so sorry. I keep

This is Milton Packer. I voted no. I think there are real concerns about the safety in this population. Particularly, these are safety signals compared with a drug that already has defined safety risks. The real interesting opportunity here is a randomized trial of epo and roxadustat in people who are epo resistant. The real wonderful opportunity here is that the sponsor could actually test its lower dosing strategy so that there is an increase in hemoglobin compared to epo because these are epo-resistant patients. They could even show that the improvement in hemoglobin results in improvement in quality of life or other benefits that one would expect with an improvement in hemoglobin, and it would so straightforward to then assess benefit to risk in a defined patient population. So the epo-resistant group seems to be a real potential for future research. DR. LEWIS: Thank you, Dr. Packer. Dr. Wang?

July 15 2021

```
DR. WANG? Yes. This is Thomas Wang. I
1
     voted no. I just want to say, despite my no votes
2
3
     on both of the voting questions, this was a
     challenging vote for me just because, again, lack
4
     of a clear-cut signal in one direction or another.
5
             I do appreciate the potential benefits of
6
7
     this medication, as well as the unmet clinical
     need, especially for the ESA unresponsive patients.
8
     I also appreciate the potential benefits of this
9
     novel mechanism of action.
10
             My hope is that the applicant is going to be
11
      able to obtain further data regarding the benefits
12
      and the risks to provide reassurance about some of
13
      the concerns that have been raised so that this
14
     medication can move forward. Thank you.
15
             DR. LEWIS:
                          Thank you, Dr. Wang.
16
             Dr. Thadhani?
17
18
             DR. THADHANI: Thank you, Dr. Lewis.
19
             Ravi Thadhani. I'm the only other person
      that voted yes, other than Dr. Crowley as noted.
20
21
      Interestingly enough, the rationale is similar to
      Dr. Kasper's comment, Dr. O'Connor's comment, and
22
```

July 15 2021

```
Dr. Packer's comment, and that is with a very
1
     careful label in terms of those individuals that
2
      are hyporesponsive, perhaps in lieu also of
3
      transfusion; but also going back to what
4
     Dr. Crowley said, the opportunity for individuals
5
      on peritoneal dialysis. We didn't talk about that,
6
7
     but there was certainly data on that.
             So there is a window, an aperture, that we
8
9
     can take advantage of.
                              I also am convinced that
      the sponsor is committed to both the risk
10
     mitigation strategies we've talked about, as well
11
     as a post-approval study perhaps in the context of
12
      the hyporesponsiveness.
13
14
             Thank you, Dr. Lewis.
             DR. LEWIS: Thank you, Dr. Thadhani.
15
             Mr. Conway?
16
17
              (No response.)
18
             DR. LEWIS: Mr. Conway?
19
             MR. CONWAY: Yes. My apologies.
      Conway. I voted no; again, my issues with the
20
21
      safety and the dosing for both NDD and DD. I think
     we're in an era where we're pushing forward for
22
```

FDA CRDAC July 15 2021 334

more transplantation, more home dialysis, more peritoneal dialysis, and I think that the patient burden is real.

I think that the convenience could be better demonstrated, but I think you have to deal with this issue of the risk and of the safety, and make certain that's clear and upfront for the patient population and the patient consumers, who are ultimately the ones who are going to be looking for guidance from FDA on safety and from their medical professionals.

In regard to the conversations that have been had here about a potential path forward, at least for some populations, I agree. My caution would be make absolutely certain that that is representative of the dialysis population in the United States; and if it's not, I think you're going to have a hard time selling it if it's only coming from the nephrologists. I think it has to be the combination of FDA nephrologists and the sponsor putting patients upfront in the design of any type of trial. Thank you very much.

July 15 2021

335

```
Thank you, Mr. Conway.
              DR. LEWIS:
1
              Dr. Cho?
2
                        Leslie Cho. I voted no for many of
3
              DR. CHO:
4
      the reasons that have been stated before.
     concerned about the higher discontinuation rate of
5
      the roxadustat in this dialysis-dependent
6
     population when compared to epo. I am also
7
      concerned about the epo/hyporesponders.
8
              I am not convinced, given the data that's
9
10
     been presented by the sponsor, that this particular
      drug would decrease, or would have equivalent
11
      thrombosis rate, or infection rate, or have less
12
     MACE or equivalent MACE. The lack of
13
14
      quality-of-life assessment in the epo/
     hyporesponders in this particular dialysis-
15
      dependent population is also a little bit
16
      concerning.
17
18
             Like Dr. Packer, I strongly urge the sponsor
19
     to do a study in the epo/hyporesponders since so
     much has been made about that particular
20
21
     population.
             DR. LEWIS:
22
                          Thank you.
```

July 15 2021

Ms. Alikhaani?

MS. ALIKHAANI: Yes. This is Jacqueline
Alikhaani. I voted no because the assessment of
the adverse events is just not altogether clear to
me. As we've been discussing all day today and all
the concerns that have been identified by other
members of the committee and others, a lot of
discrepancies that are really critical, and they
need to be addressed properly to be fair to the
patient who will be relying on this medication.

Those patients are putting their faith and their trust in all of us to get it right. So we have to do due diligence on every level to make sure we get things as best as we can and as correct as we can before we move forward.

As I mentioned before, I have family members living with this issue and some that have passed away, so it's also personal for me as well. I'm really just resonating with all the testimony of the patients who spoke to us today, and I think that we have to not let them down.

A lot of the testimony has just been very

July 15 2021

337

heartbreaking for me, and also the fact that we 1 can't move forward because of these discrepancies 2 on the safety issue. That's just as heartbreaking 3 for me because we need to do that before we can 4 help the patients the way they need to be helped. 5 Thank you. 6 7 DR. LEWIS: Thank you. Dr. Merz? 8 9 DR. BAIREY MERZ: Noel Bairey Merz. I voted no for the reasons stated. I think that these 10 safety concerns appear quite real. I don't think 11 12 FDA should approve on the basis of mitigation modeling. And because there is an alternate, we 13 14 should explore more how underserved the epo-resistant patients are, and I would use this 15 good hearing and this good information to start to 16 plan studies to understand that better. Thank you. 17 18 DR. LEWIS: Thank you, Dr. Bairey Merz. 19 This is Dr. Julia Lewis. I voted no. I voted no for many of the same reasons listed above. 20 21 However, I will also add that doing a study in the hyporesponsive patients would be a fantastic 22

July 15 2021

338

adjunct study, but I don't think it would be a 1 stand-alone study as a path to approval. 2 It's only 9-10 percent of our population, 3 maybe less. I think it's difficult to define in 4 some cases, and their safety profile may be 5 different than the general dialysis population or 6 certainly the non-dialysis population. So I think 7 that it could be done in addition but not in place 8 of a large, well-designed, efficient, 9 representative population study to better explore 10 the safety signals. 11 Dr. Moliterno? 12 DR. MOLITERNO: Thanks, Dr. Lewis. 13 14 David Moliterno, and I voted no. I've got a lot of notes, but others have already spoken to 15 I don't agree with all the comments from 16 everyone else, but that's ok. 17 18 I do think this drug has great potential. 19 Remember, this is the only oral agent that could potentially be available in the near term, so I 20 21 think that while I would love to see it for all dialysis-dependent patients as appropriate, I think 22

July 15 2021

339

that it's ok to get a side door, even if it's 1 10 percent of the population who may be epo or 2 3 other agent resistant. So I would encourage the sponsor to spend more time thinking about how to 4 get initial approval in them with secondary and 5 tertiary studies and continue to expand the label. 6 I look forward to seeing how the European 7 regulatory agency views the drug, and I look 8 9 forward to more data coming out of Asia as there's continued experience there. Thank you. 10 DR. LEWIS: Thank you, Dr. Moliterno. 11 Dr. Parsa? 12 DR. PARSA: Afshin Parsa, and I also voted 13 This is more of a conditional no since there 14 was really no mechanism for parsing out when yes 15 and when no, so I actually somewhat agree with 16 Dr. Thadhani and the yeses and the noes here. 17 18 At the end of the day, I think there's 19 potential and a good path here moving forward for the epo-resistant patients, but there certainly 20 21 doesn't seem to be much of a signal for the larger population, even if it's a weak [indiscernible] and 22

July 15 2021

340

somewhat consistent trend for increased risk with 1 otherwise not much benefit in the larger dialysis 2 population. 3 DR. LEWIS: Thank you, Dr. Parsa. 4 I will attempt to summarize this. I think 5 the two people who voted yes did so because they 6 felt that there was an unmet need, particularly for 7 home dialysis patients, and there was more control 8 over this population of patients, and the patients 9 and physicians involved would understand the risks. 10 There also was an interest in having a very 11 careful label perhaps for only hyporesponsive 12 patients and maybe home patients, and that would 13 give a doorway to a risk mitigation and 14 post-approval process as well. 15 I think the majority who had voted no are 16 still concerned about the adverse safety signal, 17 18 particularly the on-study mortality. I don't think 19 people are convinced that modeling supported by a phase 2 study can replace a clinical trial for 20 21 safety. I think there was a lot of interest in 22

July 15 2021

341

particularly studying the ESA-resistant patients 1 and maybe even a possible approval for them maybe 2 at a reduced dose, and maybe do a study with them. 3 But that did not substitute for, in some way, 4 examining the safety in the wider population. 5 I think people felt challenged by it. 6 think we all felt challenged by the unmet need for 7 alternatives in this population, but the safety 8 concerns outweighed the desire to help meet that 9 unmet need. 10 Before we adjourn, are there any last 11 comments from the FDA? 12 Dr. Unger? 13 14 DR. UNGER: Hi. Well, I would like to thank everyone who participated today in this challenging 15 application and this far-reaching discussion. I 16 thought it was excellent. I'd like to thank all of 17 18 you for your thoughtfulness, for your objectivity, 19 and I thank the people who have tried to follow the data and the science. Those are our guiding stars 20 21 at the FDA and I really appreciate that. I know this wasn't the vote that the 22

July 15 2021

applicant had hoped for, but I would like to credit
the applicant for running I think a very impressive
development program here. There wasn't always
agreement with the FDA, apparently, but
nevertheless, it was an impressive program. It's
the largest body of data we may ever see for a drug
like this, so I think a shout-out to them is in
order as well. And again, thank you to everyone.

Adjournment

DR. LEWIS: I would like to also thank everyone, but I specifically thought both the FDA and the sponsor gave us very, very well-written briefing documents, which very fairly and clearly presented the data. I do also appreciate the sponsor's quantity of data, which was also very helpful.

I want to thank all the speakers of the open hearing who joined us for sharing their time and thoughts with us. I want to thank the panel members. I want to thank particularly our patient and consumer reps for whom I know although this was hard -- obviously you could hear in everyone's

ITEM 5. OTHER INFORMATION.

In a press release on April 6, 2021, the Company clarified that certain previously disclosed cardiovascular safety analyses from the roxadustat Phase 3 program for the treatment of anemia in chronic kidney disease included post-hoc changes to the stratification factors, and provided additional data from the cardiovascular safety analyses with the pre-specified stratification factors. As stated at that time, the Company initiated an internal review to ensure this does not occur in the future. We have now completed that review.

The Company's major findings are as follows:

- The underlying data used for cardiovascular safety analyses are accurate, with no data integrity issues with the data used to generate such analyses.
- In its NDA, the Company calculated accurately and described both sets of analyses, including the statistical methodologies and stratification factors utilized. The statistical analyses using post-hoc stratification factors were designated as "primary" analysis, and the statistical analyses using pre-specified stratification factors as a "sensitivity" analysis.
- We believe a number of elements contributed to the fact that the cardiovascular safety analyses designated as primary included post-hoc stratification factors. These include a complex data set with data from multiple clinical studies conducted by three companies, and a lack of clarity in the pooled cardiovascular safety analysis plans which identified multiple statistical methods and assessment periods.
- In addition, this information was compartmentalized within the organization, which relied on the founder and then-CEO to make key decisions and facilitate internal communication between groups. He unfortunately passed away in August 2019 prior to public disclosure of the detailed pooled safety analyses and the NDA filing.
- Those responsible for the statistical analyses believed that it was a reasonable and valid way to analyze and present the data.

Management is taking steps to ensure the Company's processes are consistent with best practices in all respects. We plan to implement and improve a number of processes and procedures, including independent quality unit oversight of clinical data management, programming, analysis, and reporting.

Those directly responsible for the decision to use post-hoc stratification factors in the primary analyses no longer work for the Company.

Exhibit 31.1

CERTIFICATION

- I, Enrique Conterno, certify that:
- 1. I have reviewed this Form 10-Q of FibroGen, Inc.;
- 2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;
- 3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;
- 4. The registrant's other certifying officer and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in Exchange Act Rules 13a-15(f) and 15d-15(f)) for the registrant and have:
- (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;
- (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;
- (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and
- (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and
- 5. The registrant's other certifying officer(s) and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):
- (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and
- (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.

Press Release

Astellas Receives European Commission Approval for First-in-Class EVRENZO[™] (roxadustat) for Adult Patients with Symptomatic Anemia of Chronic Kidney Disease

Roxadustat is the first orally administered hypoxia-inducible factor (HIF) prolyl hydroxylase (PH) inhibitor available for adult patients with anemia associated with chronic kidney disease in Europe

TOKYO, August 20, 2021 – Astellas Pharma Inc. (TSE: 4503, President and CEO: Kenji Yasukawa, Ph.D., "Astellas") and FibroGen, Inc. (Nasdaq: FGEN, CEO: Enrique Conterno, "FibroGen") today announced that the European Commission (EC) has approved EVRENZOTM (roxadustat) for the treatment of adult patients with symptomatic anemia associated with chronic kidney disease (CKD).

"We are very pleased EVRENZO has been approved as the first oral HIF-PH inhibitor to treat adult patients with symptomatic anemia associated with CKD in the European Union," said Steven Benner, M.D., M.H.S., President of Development, Astellas. "Today's approval provides patients, regardless of dialysis status, with a first-in-class treatment option to address the multifaceted nature of this condition. We look forward to making roxadustat available to adult patients with anemia of CKD in countries across the European Union."

CKD impacts one in 10 people globally, of whom one in five are affected by anemia. 1, 2 Anemia of CKD is often untreated or not treated to target, and is associated with reduced quality of life and progression to adverse cardiovascular (CV) and renal outcomes. 3-5

"Anemia is a significant and early complication of CKD that occurs with greater frequency and impact as CKD worsens, affecting patients' day-to-day living, self-care and mobility," said Jonathan Barratt, Ph.D., FRCP, Consultant Nephrologist and the Mayer Professor of Renal Medicine at the University of Leicester, United Kingdom. "This approval represents a step forward in providing patients with an efficient and simple option to manage anemia symptoms and maintain target hemoglobin levels to minimize the impact on their quality of life."

Roxadustat is the first orally administered HIF-PH inhibitor available in the European Union. Roxadustat increases hemoglobin (Hb) levels through a different mechanism of action compared to injectable erythropoiesis-stimulating agents (ESAs) which are typically co-administered with intravenous iron. As a HIF-PH inhibitor, roxadustat activates the body's natural response to reduced oxygen levels in the blood. This response involves the regulation of multiple, coordinated processes that allow management of anemia with a reduced use of intravenous iron.

"HIF-PH inhibitors represent a major advance in the treatment of anemia of CKD," said Mark Eisner, M.D., M.P.H., Chief Medical Officer, FibroGen. "Roxadustat provides a novel breakthrough for patients who suffer from this condition."

This approval follows the European Medicines Agency's (EMA) Committee for Medicinal Products for Human Use (CHMP) positive opinion to authorize roxadustat in June⁶ based on results from a comprehensive pivotal Phase 3 program comprising of eight multicenter and randomized studies, which involved 9,600 patients worldwide.⁷⁻¹² The results of this program showed roxadustat was efficacious in achieving and maintaining target Hb levels (10-12g/dL) in patients with symptomatic anemia of CKD regardless of dialysis status and irrespective of prior ESA treatment.⁷⁻¹¹ The safety profile observed in the roxadustat development program is reflective of the CKD populations studied and comparable to ESAs.⁷⁻¹²

The EC has the authority to approve medicines for European Union member states, as well as in the European Economic Area (EEA) countries Iceland, Norway, Liechtenstein.¹³

The EC approval of roxadustat triggers a milestone payment of \$120 million by Astellas to FibroGen, and FibroGen will also receive royalties based upon European net sales.

About CKD and Anemia of CKD

Chronic kidney disease (CKD) is a progressive disease characterized by gradual loss of kidney function that may eventually lead to kidney failure or end-stage renal disease, requiring dialysis or kidney transplant.¹⁴ Many patients with CKD die of cardiovascular complications before progressing to kidney failure and as such the prevalence of early kidney disease is much greater than end-stage disease.^{14, 15} CKD impacts one in 10 people globally and is predicted to become the fifth most common cause of premature death globally by 2040.^{1, 16}

Anemia, a serious medical condition in which patients have insufficient red blood cells and low levels of hemoglobin, is a common early complication of CKD affecting approximately 20% of CKD patients.^{2, 17} Anemia of CKD is associated with an increased risk of hospitalization, cardiovascular complications and death, and can also cause significant fatigue, cognitive dysfunction and reduced quality of life.^{4, 18} Blood transfusions are used for treating severe anemia, however, they may reduce a patient's opportunity for kidney transplant and can increase the risk of infection and/or complications such as heart failure and allergic reactions.^{19, 20}

About Roxadustat

Roxadustat, an oral medicine, is the first in a new class of medicines, HIF-PH inhibitors, that promote erythropoiesis, or red blood cell production, through increased endogenous production of erythropoietin; improved iron absorption and mobilization; and downregulation of hepcidin. Roxadustat is also in Phase 3 clinical development for anemia associated with myelodysplastic syndromes (MDS) and Phase 2 for chemotherapy-induced anemia (CIA).

Roxadustat is approved in EU member states, including the EEA countries, as well as in Japan, China, Chile and South Korea for the treatment of anemia of CKD in adult patients on dialysis (DD) and not on dialysis (NDD). Several other licensing applications for roxadustat have been submitted by Astellas and AstraZeneca to regulatory authorities across the globe and are currently in review.

Astellas and FibroGen are collaborating on the development and commercialization of roxadustat for the potential treatment of anemia of CKD in territories including Japan, Europe, Turkey, Russia and the Commonwealth of Independent States, the Middle East, and South Africa. FibroGen and AstraZeneca are collaborating on the development and commercialization of roxadustat for the potential treatment of anemia of CKD in the U.S., China, other markets in the Americas, in Australia/New Zealand, and Southeast Asia.

Important Safety Information

The full European Summary of Product Characteristics (SPC/SmPC) for roxadustat will be available from the European Medicines Agency at www.ema.europa.eu ²¹

About Astellas

Astellas Pharma Inc., is a pharmaceutical company conducting business in more than 70 countries around the world. We are promoting the Focus Area Approach that is designed to identify opportunities for the continuous creation of new drugs to address diseases with high unmet medical needs by focusing on Biology and Modality. Furthermore, we are also looking beyond our foundational Rx focus to create Rx+® healthcare solutions that combine our expertise and knowledge with cutting-edge technology in different fields of external partners. Through these efforts, Astellas stands on the forefront of healthcare change to turn innovative science into value for patients. For more information, please visit our website at https://www.astellas.com/en.

About FibroGen

FibroGen, Inc. is a biopharmaceutical company committed to discovering, developing and commercializing a pipeline of first-in-class therapeutics. The Company applies its pioneering expertise in hypoxia-inducible factor (HIF) and connective tissue growth factor (CTGF) biology to advance innovative medicines for the treatment of unmet needs. The Company is currently developing and commercializing roxadustat, an oral small molecule inhibitor of HIF prolyl hydroxylase activity, for anemia associated with chronic kidney disease (CKD). Roxadustat is also in clinical development for anemia associated with myelodysplastic syndromes (MDS) and for chemotherapy-induced anemia (CIA). Pamrevlumab, an anti-CTGF human monoclonal antibody, is in clinical development for the treatment of locally advanced unresectable pancreatic cancer (LAPC), Duchenne muscular dystrophy (DMD), and idiopathic pulmonary fibrosis (IPF). For more information, please visit www.fibrogen.com.

Astellas Cautionary Notes

In this press release, statements made with respect to current plans, estimates, strategies and beliefs, and other statements that are not historical facts are forward-looking statements about the future performance of Astellas. These statements are based on management's current assumptions and beliefs in light of the information currently available to it and involve known and unknown risks and uncertainties. A number of factors could cause actual results to differ materially from those discussed in the forward-looking statements. Such factors include, but are not limited to: (i) changes in general economic conditions and in laws and regulations, relating to pharmaceutical markets, (ii) currency exchange rate fluctuations, (iii) delays in new product launches, (iv) the inability of Astellas to market existing and new products effectively, (v) the inability of Astellas to continue to effectively research and develop products accepted by customers in highly competitive markets and (vi) infringements of Astellas' intellectual property rights by third parties.

Information about pharmaceutical products (including products currently in development) that is included in this press release is not intended to constitute an advertisement or medical advice.

FibroGen Forward-Looking Statements

This release contains forward-looking statements regarding our strategy, future plans and prospects, including statements regarding the development and commercialization of the Company's product candidates, the prevalence of CKD and anemia, the potential safety and efficacy profile of our product candidates, our clinical and regulatory events. These forward-looking statements include, but are not limited to, statements about our plans, objectives, representations and contentions and are not historical facts and typically are identified by use of terms such as "may", "will", "should", "on track", "could", "expect", "plan", "anticipate", "believe", "estimate", "predict", "potential", "continue" and similar words, although some forward-looking statements are expressed differently. Our actual results may differ materially from those indicated in these forward-looking statements due to risks and uncertainties related to continued progress and timing of our various programs, including the enrollment and results from ongoing and potential future clinical trials, and other matters that are described in our Annual Report on Form 10-K for the fiscal year that ended December 31, 2020 and our Quarterly Report on Form 10-Q for the quarter ended June 30, 2021 filed with the Securities and Exchange Commission (SEC), including the risk factors set forth therein. Investors are cautioned not to place undue reliance on these forward-looking statements, which speak only as of the date of this release, and we undertake no obligation to update any forward-looking statement in this press release, except as required by law.

Explanation of Responses:

- 1. Shares sold pursuant to a 10b5-1 plan.
- 2. The shares were sold at prices ranging from \$22.75 to \$23.70. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 3. The shares were sold at prices ranging from \$23.75 to \$24.125. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 4. The shares were sold at prices ranging from \$23.45 to \$24.35. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 5. The shares were sold at prices ranging from \$24.45 to \$25.15. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 6. The shares are held by BioGrowth Partners, LP. The reporting person is the sole general partner of BioGrowth Partners, LP and has sole voting and dispositive power over the shares held by BioGrowth Partners, LP.
- 7. Fully vested.

Explanation of Responses:

- 1. Shares sold pursuant to a 10b5-1 plan.
- 2. The shares were sold at prices ranging from \$59.25 to \$60.225. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 3. The shares were sold at prices ranging from \$60.25 to \$60.65. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 4. The shares were sold at prices ranging from \$59.25 to \$60.15. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 5. The shares were sold at prices ranging from \$59.25 to \$60.20. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 6. The shares were sold at prices ranging from \$60.225 to \$61.10. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.

 7. The shares were sold at prices ranging from \$60.15 to \$61.10. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 8. The shares are held by BioGrowth Partners, LP. The reporting person is the sole general partner of BioGrowth Partners, LP and has sole voting and dispositive power over the shares held by BioGrowth Partners, LP.
- 9. Fully vested.

Explanation of Responses:

- 1. Shares sold pursuant to a 10b5-1 plan.
- 2. The shares were sold at prices ranging from \$57.955 to \$58.95. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 3. The shares were sold at prices ranging from \$58.96 to \$59.61. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 4. The shares were sold at prices ranging from \$58.22 to \$59.15. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 5. The shares were sold at prices ranging from \$59.23 to \$59.50. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 6. The shares were sold at prices ranging from \$58.33 to \$59.30. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 7. The shares were sold at prices ranging from \$59.33 to \$60.29. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 8. The shares were sold at prices ranging from \$58.62 to \$58.73. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 9. The shares were sold at prices ranging from \$59.73 to \$60.19. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 10. The shares are held by BioGrowth Partners, LP. The reporting person is the sole general partner of BioGrowth Partners, LP and has sole voting and dispositive power over the shares held by BioGrowth Partners, LP.
- 11. Fully vested.

Explanation of Responses:

- 1. Shares sold pursuant to a 10b5-1 plan.
- 2. The shares were sold at prices ranging from \$54.20 to \$55.17. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 3. The shares were sold at prices ranging from \$55.22 to \$55.26. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 4. The shares were sold at prices ranging from \$54.29 to \$55.12. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 5. The shares were sold at prices ranging from \$52.79 to \$53.74. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 6. The shares were sold at prices ranging from \$53.80 to \$54.78. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 5. The shares were sold at prices ranging from \$54.88 to \$55.46. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 8. The shares were sold at prices ranging from \$52.77 to \$53.57. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 9. The shares were sold at prices ranging from \$53.80 to \$54.17. The reporting person will provide upon request to the SEC, the issuer or security holder of the issuer, full information regarding the number of shares sold at each separate price.
- 10. The shares are held by BioGrowth Partners, LP. The reporting person is the sole general partner of BioGrowth Partners, LP and has sole voting and dispositive power over the shares held by BioGrowth Partners, LP.
- 11. Fully vested.

Remarks:
